It's an important difference, of course.

Cross-posting off-topic drivel to groups you don't read can
sometimes be quite annoying, too.

Happy new year!

> Argh...Missed MasterBlazer..When did this come out Julian? (Was an Amiga
> owner but missed this one)

It came out in 1990 from Rainbow Arts. We were only involved insofar that our Amiga version of the Fractalus landscape code was used in the intro. It was a flight through the asteroid canyons. Since at that point we knew that the Amiga simply was not suited for a convincing Fractal landscape, the code (which was the old Atari 8-Bit method in higher resolution and greater view-depth) at least found some usage. The game (Masterblazer) itself made the same mistake - it didnï¿½t improve/change the 8-Bit game at all.

> Saw it at the ECTS in London Julian. Guy who was showing it said that it
> wasn't complete. Looked fine....

The ECTS demo was pretty bad. Itï¿½s out in Europe in mid-January. Here in the US we are getting good reviews. Most people say itï¿½s by far the best Star Wars console game, yet (which is not very hard to do:).

> Were there any other Lucas bits (old era) due/might to be converted?

I donï¿½t see it happen. Aside from us nobody was or is interested anyways. I hope they are going to do Monkey Island sequels or another Maniac Mansion game...

> Whats next from you guys on the PSX (sorry group)

Sorry, no more PSX. We are focusing on N64 right now and then itï¿½s off to the PSX 2 (or 2000 or whatever).

> and sorry, is Turrican dead or are we due <cheer> more episodes.

We are doing a Turrican-follow-up, but on N64 - sorry....

> Many thanks from a guy who was at the show where you guys showed Katakis

That must have been the same show where Activision saw it and wanted to sue our butts off - unless we did an official R-Type port for no money and in three months. Ah, those were the times :)

Cheers,

Julian

One thing about Cybermen is that they actually got LESS robotic over time.
Back in the Troughton days they had this little flap that opened up where
their mouths were when they talked... looked pretty darn inhuman to me.

But by the end they just painted their chins silver and called it a day.

Well, despite the lack of netiquitte involved in posting the binary, I have, as promised, set up an initial page which will be dedicated to any and all Dr. Who companions I can find pictures of.

So if anyone else has pics of the sexy Dr. Who girlies they'd like to share with the world... or hell, any good Dr. Who stuff, just e-mail them to me, or point me to a URL where I can find them. (Then they'll be online within an hour of me getting them, and no-one need be worried about wasted bandwidth on the NewsGroups.) :-) BTW, does anyone know of a URL for other good pics I could add here? (looks just a little sparse at the mo.)

Just go to http://www.caverock.net.nz/~nathan/gallery/gallery.html The link should be *quite* obvious. :-) And, y'all be pleased to know, this one should be viewable on *all* browsers... I actually test everything with Lynx, believe it or not.

In the mean-time, I think I'll just expand the page with other trivial tv-pics I have... Star-Trek (mostly Diana Troi), Alley McBeal and the Spice Girls... (But don't worry... I'll put a big warning before the Spice Girls one, I realise how much some people here like them.) :-)

Later,
Nathan.

Damn straight! Hehehe....

Hey, I didn't start the fire on cross posting, though I have fanned the flames a little I'll admit. What can I say? I believe in a common thread between computer systems... I get to see posts from other usegroups that I didn't know existed, and we have a nice Dr. Who discussion. Works out for everyone. ;)

As for no binaries.. tell you what, next time I post a pic I'll warn in the message title so you can skip over it. Sound fair enough? Sorry for the lack of warning last time.

Doc Clu - who always enjoys good rounds of sci-fi discussions, and especially Who discussions. (grin)

Daisy-chain every system using the "F" connector (75 Ohm coaxial), except the system you play the most, which should be hooked up thru the S-Video jack.

> Texas Instruments TI-99/4A

I do have rather large number of system hookled to one TV and it can apply to hooking it to computer. First of all, my computer has it's own VCR for video digitizing and still shots.

I have my older system (2600, 7800, Intellivision, and Colecovision) hooked to a multi switch. Since all the cables are 75 ohms, I used RCA female to F type male adaptor and bypassed the old single system switch box.The output from that switch are wired through the auto switch box of 5200 and Sega Master System, then the video input in my VCR. Oh yeah and an atenna in one of the input fior plain TV viewing.

The newer system are connected via AV cables (Jaguar, TurboGrafx-16, Sega Saturn, Sega Genesis with CD and 32X, NES, SNES, N64, and PSX) to 2 separate multi switch box. (No one seems to carry anything that can switch between more than 4 inputs) and then a single A/B switch box to switch between the 2 bigger switch box. (All are labeled for clarity) and then into the AV input of my VCR.

This may seems messy but all the system are kept isolated from each other to prevent video interference. And all switches are labeled so anyone wishing to play my setup can figure out on it's own.

I do have Commodore 64 that I still use but they are in another room with it's own monitor. With a printer, 2 floppy drives, monitor, and a C64, all those power strips that is piling around mehind the shelves would start to melt. Right now, they look like christmas lights before you untangle them for Christmas decorating.

Now if I can figure out where to put all those 2600, 5200, 7800, Intelly, and Colecovision games, my room would seems a lot cleaner. (I recently bought a rack designed to hold 500 CDs and it is almost full holding 150 NES carts)

Re: Pro_Term: This is an unfamiliar name to me. Does that mean, then, that there is already a program quite capable of handling the role of a web browser? If so, then why should I add to the confusion by putting "Project: PHOENIX" together? And if there isn't, but this Pro_Term is all set for an add-on module to handle Lynx-style web browsing, then I agree that it would be a great idea to do it, or adjust Pro-Term as a whole to handle the role (why re-invent the wheel, someone said in this group a brief time ago).

I hated how in the NES Ultima 4 how you couldn't see the monsters coming
toward you.You'd just enter combat with out warning (outside).
And the graphics for the dungeons weren't as good.
(NES only supports 40-column multi-coloured text;no graphics)
And of course there's that thing that I hate about all NES games,how the
playfield has that little flicker to it.Much like the flicker in HIP
mode. (not to be confused with the sprite flicker)

we are still exploring everything we got when we got pro,we have to run a bussiness first and we need to sit down and browse through everything first,yes we have programmmers who write stuff,but none who can handle a browser,we have many irons in the fire,and some of the programmers of course only want to do stuff that they are interested in and some do it just on a part time basis,and one who is good,but he is on another planet and cannot be trusted,on the other hand all of the rest are up into there armpits with work,only one has internet access,all of the rest are like me,old diehards who want a 8-bit browser,as far as pro term is concerned,we would love to develope it,but it is in action,we only have 2 action programmers who are steady,one is great,the other one is the space cadet,if you know action,i will get you source for pro term after you have sighned a non disclosure form,and i will let you take a rip at it,but we have only so many people and so much time and so many projects,that we need help in doing all of this,and the market is small so money is tight,so if you or anybody else out there wants to help in any way please do,we have done everything on our own know for the last few years and it is hard with no help,every one just wants to do emulators not the real thing,there are lots of people who want the real thing yet,so i kinda was hoping that i could help you out with a few goodies for programming,but bob brought up a good idea,and i am glad that he did,any way think about it,and happy new years to everyone,thanks,
lance

Fascinating idea! First off, what is Dandy and tell me more about that Zombie game. :) I would love to learn more about them since there are so few of the games that made use of all four joystick ports.

Why is that? Anyone have a theory?

One classic four player game I would love to see on the Atari 8-bit is Warlords from the 2600 world. Now THAT was a fun four player (Paddle) game.

You were mentioning a gameboy adapter for the Atari. Hold that idea for a moment.. I have been pondering something similar... but wondering about methods of converting 2600 and 5200 game cartridges to the 8-bit. What would it take?

The 2600 was a 8-bit machine at heart right? What were the differences?

And the 5200 WAS a Atari 8-bit with different controllers. If you take the code for a 5200 game and a 8-bit game, what is different? How are the chip's different? Could a 8-bit cartridge be altered to accept a game chip from a 5200 cartridge?

As usual, questions I thought should be asked once. ;)

Well said! I would say the Borg are actually a mix between the cybermen and the daleks. Borg look like Cybermen, even move like Cybermen. But they seem to act like daleks.

Borg: Resistance is futile
Daleks: Resistance is futile.

Borg: You will be exterminated.
Daleks: You will be illiminated.

Borg usually talk of being a higher life form, thus making all others inferior to the borg design.

Daleks: We are the superior beings!

Interesting... ;)

Jim,

This is what you need to have set up on the ctrl list on the BB for the
EZ135.

0,0 for U#,Lun
01 for Heads
3195 for Cylinders
07 for Step
512 for Sector Size

Works for me!

32. How to hook up many systems to a computer with TV tuner card?

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-01 00:00:00 UTC
From: Jason Whorton <jason@microxl.com>
Message-ID: <76j6up$m7j$1@remarQ.com>
Source record: 56834
Cross-posted to: rec.games.video.classic,comp.sys.cbm,comp.sys.ti,comp.sys.atari.8bit,rec.games.video.atari,rec.games.video.nintendo,rec.games.video.sega,bit.listserv.coco

Hello. I am planning to hook up as many of my video game and old computer systems as possible to my PC, which has a TV tuner card with "F" connector (cable TV), RCA stereo audio and video inputs, and S-Video inputs. I know some of you have multiple systems connected. I do not own a TV, by the way. I am wondering what is the best/easiest way to do this. If anyone has any suggestions on hooking up the following systems, please e-mail me and/or post it here.

Atari Super Pong
Atari 2600
Atari 5200
Atari 7800
Atari Jaguar
Atari 800XL
Colecovision
Commodore VIC-20
Commodore 64
Emerson Arcadia 2001
Intellivision (the gold and brown one)
Nintendo NES
Nintendo SNES
Nintendo 64
RCA Studio II
Sega Master System
Sega Genesis
Tandy CoCo 3
Texas Instruments TI-99/4A

Thank you,
Jason Whorton

In the sacred domain of comp.sys.sinclair didst Doctor Clu <clu-da-bard@geocities.com>
eloquently scribe:
: Borg: You will be exterminated.
: Daleks: You will be illiminated.

Borg: You will be ASSIMILATED.
Not exterminated.

EXTERMINATE!!! was the Daleks catchphrase.

The borg just wanted to assimilate all suitable lifeforms into thier
collective, not destroy them.

That's more in the field of Species 8472... Or whatever...

: Borg usually talk of being a higher life form, thus making all others
: inferior to the borg design.

: Daleks: We are the superior beings!

Daleks don't force other races into becoming more Daleks.
That's what the Cybermen were for.

Nice collection. You can do a couple of things and maybe should do a combination. First put the Genesis into the S-Video (if you have the cable). Second get a 4 input, unpowered, RCA plugged selector box from the shack (about $20?). Plug the Jaguar, NES, SNES, and 64 into that (if you have those cables). Then find an RF adapter for the rest and run them inline to the Coax input. This setup, IMHO will provide the best picture for the systems that have the most graphic use.
Later!

To Mathy in special...
My XEGS did exactly the same when I got it. I think I have one of the same run as you have, the Italian I think...

After having replaced the O.S.Rom (800XL-Rom) and one RAM-chip it worked again, uhh, not again, the thing has probably never worked since it came right out of the box and has never worked, even it was a new one!

The dis-advantage I have now, is that I can't use the internal BASIC anymore. Also Missle-Command is of course not available in the installed 800XL-Rom...

That's OK, I don't read these groups. I'm sure it's all
very interesting to you lot, though, otherwise you wouldn't
be cross-posting it all over the place.

I'm sure there's some irony in here somewhere ;-)

: Nice collection. You can do a couple of things and maybe should do a
: combination. First put the Genesis into the S-Video (if you have the
: cable). Second get a 4 input, unpowered, RCA plugged selector box from the
: shack (about $20?).

$24.99 actually. radio shack part number 15-1956 :)

: Plug the Jaguar, NES, SNES, and 64 into that (if you
: have those cables). Then find an RF adapter for the rest and run them
: inline to the Coax input. This setup, IMHO will provide the best picture
: for the systems that have the most graphic use.

my collection isn't nearly so impressive, but then i'm still in college. :)
2600
supercharger
5200
7800
jag w/ cd
nes
snes
sega master sys
genesis
intv
ti-99/a
vic-20

i've got them all connected to my entertainment center. affectionately
know as the arcade. :)
in my attempts to find cheap ways to connect them all at once, i've
learned a few things.
1. the automatic game switches look for a potential (+5v iirc) on the
game line. that's a recent development w/ the (nes?) snes and genesis.
the 7800 and prior, intv, etc won't send the signal (unless modified)
and can't be used with the auto switch.
2. chaining game switches is a bad idea (tm). sure, you can do it. but
i've found that the more you stick on the chain, the more interference
you start losing signal quality.
3. the use of cable splitters (also known as y's) to string all the
machines onto one cable is also a bad idea. again, you can do it, but
it'll give you a noisy signal.

best thing to do is get 1+ rca switchbox (eg: the one above) for those
machines that have (or you want to modify to have) rca (composite) outs.

then get however many rf switches you'll need to connect the rest of your machines. makes for a confusing array, unless everything's well marked, but it helps immensely.

while we're advertising radio shack, here's a couple good switches:

15-1249 ($6.99) is a 2-way pushbutton switch
15-1248 ($10.99) is a 3-way pushbutton switch

of course, if you go the way i did, you end up having to by a length of coax cable and a bunch of connectors to string all the switches together.

I would add to the 600XL(or any Xl/XE) that while the computer is
open, pushing down on all socketed chips can fix many problems.
If that doesn't, then actually pulling them and putting them back
in might.(static procedures!) And this problem can be sourced
from the 6502, Antic, or the GTIA. Even bad roms. In this case,
swapping each out with known good ones is the next route.

>mech when one of mine finally do pop a gasket.

Probably not. If the drive is old enough(no electronics), then
it can be used. But modern PC type drives contain control
electronics and uses a 25 conductor ribbon cable. The 1050
(and 810) did all of that them selves so used a drive with
indiviual connectors for each item. The XF551 however can use
modern PC drives.

No no no no! Just e-mail it straight to me again, and it'll
be up on the Web-site by the time the post of the URL has
propogated through the newsgroups dude! (Great pic by the
way.)

Netiquitte does dictate that binaries should never be posted
to a non-binary group. Rather, put them in a binary group,
or put them on a web/ftp site and post the URL. There are
lots of good reasons for this. (Not least the number of
"Don't post binaries!" responses.) :-)

Nathan.

NO NO NO! YOU SHOULD NOT POST BINARIES HERE AT ALL.

If you want us to see pics, then upload them to a website, then send the
link to us.

All the newsgroups you have sent the picture to are not BINARY groups
(they don't have binaries in their title), so no files should be sent.

Thanks, thanks :-)))

>BTW: what are you using for your eprom
>burner? I'm looking to get one, and don't want to spend a fortune. Any
>recommendations?

Not direct, sorry. What will you program (EPROM, EEP, PAL/GAL,PIC,AVR)?

My (old) eprom burner is selfmade, also the pc dos software.
My PIC prommer (LPT-Port) and the W9x software are also selfmade. (I have the Microchip PIC starterkit too).
For the AVRs im using the available starterkits and the corresponding software.

I think to use the original starterkits/software is the best way to program new processors, they are relative cheap and there are new processors every month, you cant be up-to-date with prommers/software from others.
Unfortunately you cant program other chips (EPROMs) with this kind of tools.

Allround burners are more expensive, first you must see wich chips you want to program...

Hope this helps a little bit...

bye, Andrï¿½.

No. Put the binary somewhere convenient (an ftp or web site) and post a
pointer to it. Failure to do so (eg. posting of another binary) may well
cause people to think of you as Doctor Cluless; I'm sure that you don't want
that...

Fortunately, said large binary was caught by my killfile due to the article
size; a fake header was generated from XOVER information, so at least I was
aware of it and exactly how much there was of it not to download.

> Sorry for the lack of warning last time.

Lack of warning is irrelevant. You will be assim--- ahem.

You might want to check out the Doctor Who Image Archive, run by Shill
at...

http://www.shill.simplenet.com/dw/dwia.htm

...although the naughty images had to be taken down, I think Steve said
Simplenet kicked a fuss up. I'd recommend my own site for pics of
Tegan, but the main T.W.A. site died when the babylon.org server did.

> in the message title so you can skip over it. Sound fair enough?

Best not, 'cos I pay to download news I dump the entire lot down to my
local drive, I don't see the headers beforehand. Best leave the
binaries to the appropriate groups, there is actually an appropriate
Doctor Who binaries group, alt.binaries.drwho.pictures

68. Re: TELNETing to Atari BBS's

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-02 00:00:00 UTC
From: Alan Sharkis <asharkis@erols.com>
Message-ID: <368E262A.D70833ED@erols.com>
Source record: 56778

I wish I knew, Larry. A guy named Greg Koby was supposed to have been working on one, but he seems to have disappeared from the mailing list. I hope he resurfaces.

Meantime, it is possible to telnet into the Fidonet Atari 8-bit echo by using:

telnet://bbs.docsplace.org

This takes you to Doc's Place BBS in Clearwater, FL. It's a BBS running on a PC, but it carries just about all the Fido echoes. The one that you're interested in is #163 on that board.

Then again, you're on AOL, and I don't remember how AOL does Telnet. If you telnet to Delphi, do you do it from AOL's Web browser, as I do from Netscape, or do you need special Telnet software (I assume available from AOL?)

(John Picken answers the question about '6' in 'bit map', ques
from Bo Scheurs(sp?))
Thanks John.
Now I understand SpDOS a little better. My books even make sense.
The byte 9 of sector 1 is the sector of the MAIN sector MAP.
I said it was the first sector of the MAIN.
So Bo's byte 133 is the 5th byte in the MAIN sector MAP. The
first four bytes are the next and previous sector MAP sectors,
which are zeros for a small MAIN, then the next 62 two byte
entries of the sector are sectors where MAIN is found. So
MAIN starts usually at sector 6 for a SD or DD disk.
My previous post showed a lot of confusion on my part.
I re-iterate John's answer because I don't see his post
at Cleve Freenet and maybe some others would like to know
the correct answer after reading my incorrect answer.
Russ

Yes, correct. The manual introduces some needless confusion by referring to "directory map sectors" and "directory data sectors". In fact, a directory is simply a file with a specific format.

BTW, directories are limited (in versions <4) to 127 entries, not 128 as in the manual so, you can stash a maximum of 126 files/subdirectories in one.

check out www.atari.com. This is what Atari has been reduced to.....a list of licenses used by corporate america!!!!! Not really a company anymore.

76. [ANN (repost)] ATasm: A MAC/65 compatible cross compiler

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-02 00:00:00 UTC
From: Mark <schmelze@cs.utah.edu>
Message-ID: <368E956D.92797C7C@cs.utah.edu>
Source record: 56786

Hi all,

It appears that the university's news server is misbehaving, so I
am resending this announcement via different ISP. If this message is
duplicated, then you can ignore the first post...

Hot on the tails of the ASSI cross compiler announcement comes a
message announcing the unveiling of (yet another) new 6502 cross
assembler called ATasm. ATasm is a mostly MAC/65 compliant macro
assembler. It comes complete with a Win9x/NT/3.1/DOS executable and
full source (which compiles cleanly under any platform with a
GNU C compiler--i.e. LINUX, SUNOS, SGI, HP, etc.)

Features:
* ATasm produces Atari native binary load object files or can
optionally target the machine state files produced by the Atari800Win
emulator (version 2.5c or greater) and the Atari800 emulator (version
0.9.8g or greater). Assembling to a state file allows much faster
development by reducing the number of intervening steps to run the
developing program.

* Conditional code generation, and code block repetition

* Rich macro support, compatible with existing Mac/65 code libraries

* Full source included

ATasm can (eventually) be found on the UMich site, or can be downloaded
at
http://www.cs.utah.edu/~schmelze/atari/index.html (follow the ATasm
link)

Comments and critiques are welcome!

>Can anyone tell me if ATARI as a company still exists????
>What ever happend to Jack Tramil (I thought this was his name)..

1. Nope. Atari was merged into another
JTT (?) company.

2. Yes, I'd like to know what has become of the Tramiels, also. They
ostensibly made
a lot of mistakes, but if it had not been for Jack, I'm convinced the line
would have died much earlier. There never would have been
the XE series and no ST's. No Lynx, no
Portfolio. And nothing could stop the
Windows jaugernaut. And all of that surplus
that will keep us in parts for years probably
would not have existed.
Larry

They bought/merged with a hard drive manufacturer named JTS, then split
off the Atari name and assets into a separate division that did
basically nothing but licensing and eventually got sold to Hasbro.

This is for all serious hardware nuts out there. Check out the following link to Xeltek. They are extremely helpfull and have decent burners at low prices. I got mine from them over a year ago and am very happy. Plus, as a student, they knocked off a percentage of the total (10% if I remember right). Granted this one (the RomMaster II) doesn't do every chip out there, but it does most of the standard 8-bit eproms, eeproms, proms, and some micros.

Check 'em out and I hope you get a good deal.

dj

> 16K battery-backed CMOS supercart emulators.

Well I mean RAM like in the Nintendo cartridges
(even the Ultra Nintendo,even though it has those little RAM cartridges)
have for saving your game.
(though never for saving scores)
So that your high-scores and such could be saved like with disk games.
That's one of the things that anoys me about cartridge systems.USeless
high-score tables that only last while the game is running.

> > The SuperCharger can tell whether you're reading or writing by the

Well remember that the VCS was just for games.Where as the cartridge ports
on the home computer might be used for more than just storing programmes.
(like hardware upgrades)

Actually it already does "360k" density,as you call it.
The reason that the IBM PC gets 360k is because it uses both sides of the disk.You can simply turn the disk over in a Atari disk drive.But the 1050 only gives you 130k per sides instead of 180k because it uses those little 128-byte sectors.You can get it tyo use 256-byte sectors with a simple ROM upgrade to the drive's controller board which will give you 360k per disk.
(but you have to flip the disk over,of course)
There are countless upgrades out there.
The US Doubler is a pretty cheap upgrade that's simply one chip replacing the ROM and adding 128 bytes of RAM.
(to hold the larger 256-byte sector)
But you lose the ability to get a list of bad sectors after a format.Other upgrades add a whole lot more RAM that buffers a whole track at a time which works great with the higher SIO rate that these upgrades give you.

As far as I know,the only Atari-brand drive that uses IBM style drives is the XF551.Of course a Percom drive can actually control other drive mechs so you might look in to that.

> My assumption is that the drive mech is using the shugart standard, but
> then again this is a computer which has lots of non-standards. :-)

Is there really such a thing as a standard disk drive?
I think that all the computers (Atari,Commodore,Apple,IBM...) each use their own type of drive.

I went there and just got a blank screen.I looked at the source and it begins
with a comment that never ends.And there's no owner defined for the file.

Naughty pictures? <drool>

What exactly is the URL for these Tegan pictures?

What is APE?

Subject: 1.1) What is an Atari 8-bit computer?

400 800 1200XL 600XL 800XL 65XE 130XE 800XE XE Game System

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor. The Atari 800 was code-named "Colleen"; the 400, "Candy."

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan, mailto:finneganj@delphi.com)
Jerry Jessop, mailto:jjessop@ix3.ix.netcom.com
Scott Emmons, mailto:scotte@center.uscs.com

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer

George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

OS PROGRAMMERS:
Larry Kaplan
David Crane
Bob Whitehead
Al Miller

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop, mailto:jjessop1@home.com writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

These MOS Technology 6502-based systems run at a clock speed of 1.79 MHz, offering 128 colors displayable simultaneously, up to 320x192 graphics resolution and up to 40x24 text resolution in 8 graphics modes and 6 text modes. Video may be displayed either on a composite video monitor in the case of the 800, or on a standard television for both systems. 4 independent sound voices are available through the audio output of the television or monitor, each with a 3 1/2 octave range, plus there is a built-in speaker for key-click and other programmable sounds. The 800 has a second cartridge port and a full-stroke keyboard, while the 400 has a single cartridge port and a membrane keyboard. Each has 4 serial controller ports and an Atari Serial Input/Output port. Originally, both the 400 and 800 were sold with 8K RAM, but later most 800's were sold with 48K and 400's with 16K. Each includes the 10K Atari Operating System in ROM.

The 800 can be fitted with 1-3 of the following two RAM modules:
CX852 8K RAM module, CX853 16K RAM module
and must be fitted with a ROM module:
CX801 10K ROM, CX801-P 10K ROM for PAL machines

[WHEN WAS THE 400/800 REVISION B OS INTRODUCED????]

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop, mailto:jjessop1@home.com adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system. The 1200XL runs most software and hardware designed for the 800 and 400, but now runs a slightly more advanced 6502C microprocessor, and includes a full 64K RAM. The single cartridge and monitor ports remain, along with 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL. These new machines include most of the features of the 1200XL minus the Function keys and the demo program. But now both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Buss Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM while the 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the 1064 Atari Memory Module.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Atari Games Corporation is a developer, marketer, licensor and publisher of coin-operated video games, having created such classics as Pong, Asteroids, Centipede, Missile Command, Gauntlet, Area 51, and San Francisco Rush Extreme Racing. Atari Games Corporation is a subsidiary of Midway Games Inc. (NYSE:MWY). The Atari Games Corporations home page is at http://www.atarigames.com.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985. The 65XE is nearly identical to the 800XL in features, minus the PBI. The 130XE, however, offers 128K RAM, plus the FREDDY chip, supporting the unique (but rarely used) ability for the 6502C and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge

Interface (ECI), continuing the powerful feature of a fast parallel port. European 65XE's include the ECI port.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE.

The 800XE, a 130XE with just 64K, was released at some point in eastern Europe. [WHEN???]

1992
Atari officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which is a subsidiary of Hasbro, Inc., for $5 million in cash.

Hasbro Interactive, Inc. is a leading all-family interactive games publisher, formed in 1995 to bring to life on the computer the deep library of toy and board games of parent company, Hasbro, Inc. (Amex: HAS - news). Hasbro Interactive has expanded its charter to include original and licensed games for the PC, the PlayStation(R) and Nintendo(R) 64 game consoles and for multi-player gaming over the Internet. Headquartered in Beverly, Massachusetts, Hasbro Interactive has offices in the U.K., France, Germany, Japan and Canada. For additional information, visit Hasbro Interactive's web site at: http://www.hasbro-interactive.com .

Atari Interactive, Inc. is a Hasbro affiliate, online at http://www.atari.com/

Subject: 1.2) What can I do with an 8-bit Atari?

What can you do with an 8-bit Atari computer system? Virtually anything you can do with any other type of computer!

Programming? Pascal, C, BASIC, Logo, Pilot, Forth, Lisp, 6502 assembler... Plus powerful unique languages like Action! and QUICK...

Word Processing? Try AtariWriter, Letter Perfect, Paperclip, TextPro, Bank Street Writer, 1st EXLent, TurboWord, Cut & Paste, Letter Wizard, Panther, Superscript...

Database? Try TurboBase, TurboFile, Synfile, Data Perfect, MicroFiler, MegaFiler, Homebase, Super Data Base 1-2-3, Small Business System...

Speadsheet? Look at Syncalc, Visicalc, TurboBase, Calc Magic, Turbo-Calc, SAM Budget...

Communications? There's Express!, BobTerm, Kermit-65, Omnicom, VT850, Chameleon, Ice-T, FlickerTerm 80, Term80...

Graphics? Print Shop, Newsroom, Blazing Paddles, Video Title Shop, Virtuoso, Movie Maker, News Station, Publishing Pro, Awardware, Page Designer, ChromaCAD, Rambrandt...

Music? Virtuoso, Music Studio, Music Construction Set, Songwriter, Electronic Drummer, Music Painter, Music Composer, AtariMusic, MIDI-Track, Digital Music System, Chaos Music Composer... The ATARI 8-bit could also be made to speak using SAM (Software Automated Mouth) by Don't Ask Software. It can speak without the use of any hardware modification.

Alternate Operating Systems? There's the Diamond Graphic Operating System; SpartaDOS X, the 64K DOS on a "supercartridge"; the S.A.M. (Screen Aided Management) 80 column Desktop System; the Ultra Speed Plus OS; the TurBoss! High Speed O/S...

Hardware? A plethora of upgrades and add-ons are available, realizing improvements in speed, memory, sound, graphics, storage media...you name it!

Education? Colorful graphics, exciting sounds and full-screen editing give rise to hundreds of quality educational software titles.

Entertainment? The 8-bit Atari has long been famous for thousands of great games.

If you want to do something with a computer, chances are you can do it on an 8-bit Atari computer. While slower than today's PC's, the 8-bit Atari is far less costly than any of these, is easier to program at the machine level or alter at the hardware level, and has been documented more thoroughly than any of the newer computing platforms. The relative simplicity in design of the 8-bit Atari also means that many people find the systems more reliable than their modern counterparts.

The software for the 8-bit Atari is sometimes more powerful than on any other platform. For example, some Bulliten Board Systems are still run on 8-bit Ataris specifically because the BBS software available can be better than that for any other type of computer. There is a reason for the relative quality of software on the 8-bit Atari. People program commercially for the latest PC's to make money; people program the 8-bit Atari because they want to -- they enjoy producing good software. It takes a team of specialized programmers to develop a major piece of software for those other systems; with the 8-bit Atari, a single person has the chance to learn the entire system, thereby developing greater pride in his programming abilities and his final product. The character of the programmer can shine through.

The 8-bit Atari owner can take pride that his/her computer platform was developed years before the IBM PC or Apple Macintosh were even on the drawing

boards, but remains as useful today as it was in 1979.

For these reasons and more, the 8-bit Atari remains a popular alternative
in today's home computer marketplace.

Subject: 1.3) What are the some of the performance features of the 8-bit Atari?

Some of this text by mailto:nbs@sonic.net (Bill Kendrick).

CLOCK SPEED:
NTSC machines: 1.78979 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

ANTIC AND THE DISPLAY LIST:
ANTIC CIO/BASIC Display Resolution Number of
Mode # Graphics # Type (full screen) Colors
---
2 0 Char 40 x 24 1 *
3 - Char 40 x 19 1 *
4 12 ++ Char 40 x 24 5
5 13 ++ Char 40 x 12 5
6 1 Char 20 x 24 5
7 2 Char 20 x 12 5
8 3 Map 40 x 24 4
9 4 Map 80 x 48 2
A 5 Map 80 x 48 4
B 6 Map 160 x 96 2
C 14 ++ Map 160 x 192 2
D 7 Map 160 x 96 4
E 15 ++ Map 160 x 192 4
F 8 Map 320 x 192 1 *
F 9 + Map 80 x 192 1 **
F 10 + Map 80 x 192 9
F 11 + Map 80 x 192 16 ***
* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16
luminances x 16 hues = 256 colors. (Four registers are for player-missile
graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video
incarnation, are totally redefinable.

PLAYER-MISSLE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four
2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also
available, as is a mode to XOR colors or blacken out colors when players
overlap (good for making three colors out of two players!) Players
and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display
List - a program which is executed by the ANTIC graphics chip every
screen refresh:

All other screen attributes (color, player/missile horizontal position,
screen width, player/missile/playfield priority, etc.) can be ajusted
at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any
line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Subject: 1.4) What is the internal layout of the 8-bit Atari?

The following four paragraphs were written by Chris Crawford and appear in De
Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc.,
1981-1982. The text been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different
from other systems. It of course has a microprocessor (a 6502), RAM,
ROM, and a (PIA). However, it also has three special-purpose (LSI) chips
known as ANTIC, GTIA, and POKEY. These chips were designed by Atari
engineers primarily to take much of the burden of housekeeping off of the
6502, thereby freeing the 6502 to concentrate on computations. While
they were at it, they designed a great deal of power into these chips.
Each of these chips is almost as big (in terms of silicon area) as a
6502, so the three of them together provide a tremendous amount of
power. Mastering the Atari 8-bit computers is primarily a matter of
mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor
dedicated to the television display. It is a true microprocessor; it has an

instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

While the 400/800 models contain a generic 6502 CPU, all of the XL/XE models contain Atari's customized 6502C chip. Alan Manuel K. Gloria, mailto:mani@pworld.net.ph writes:

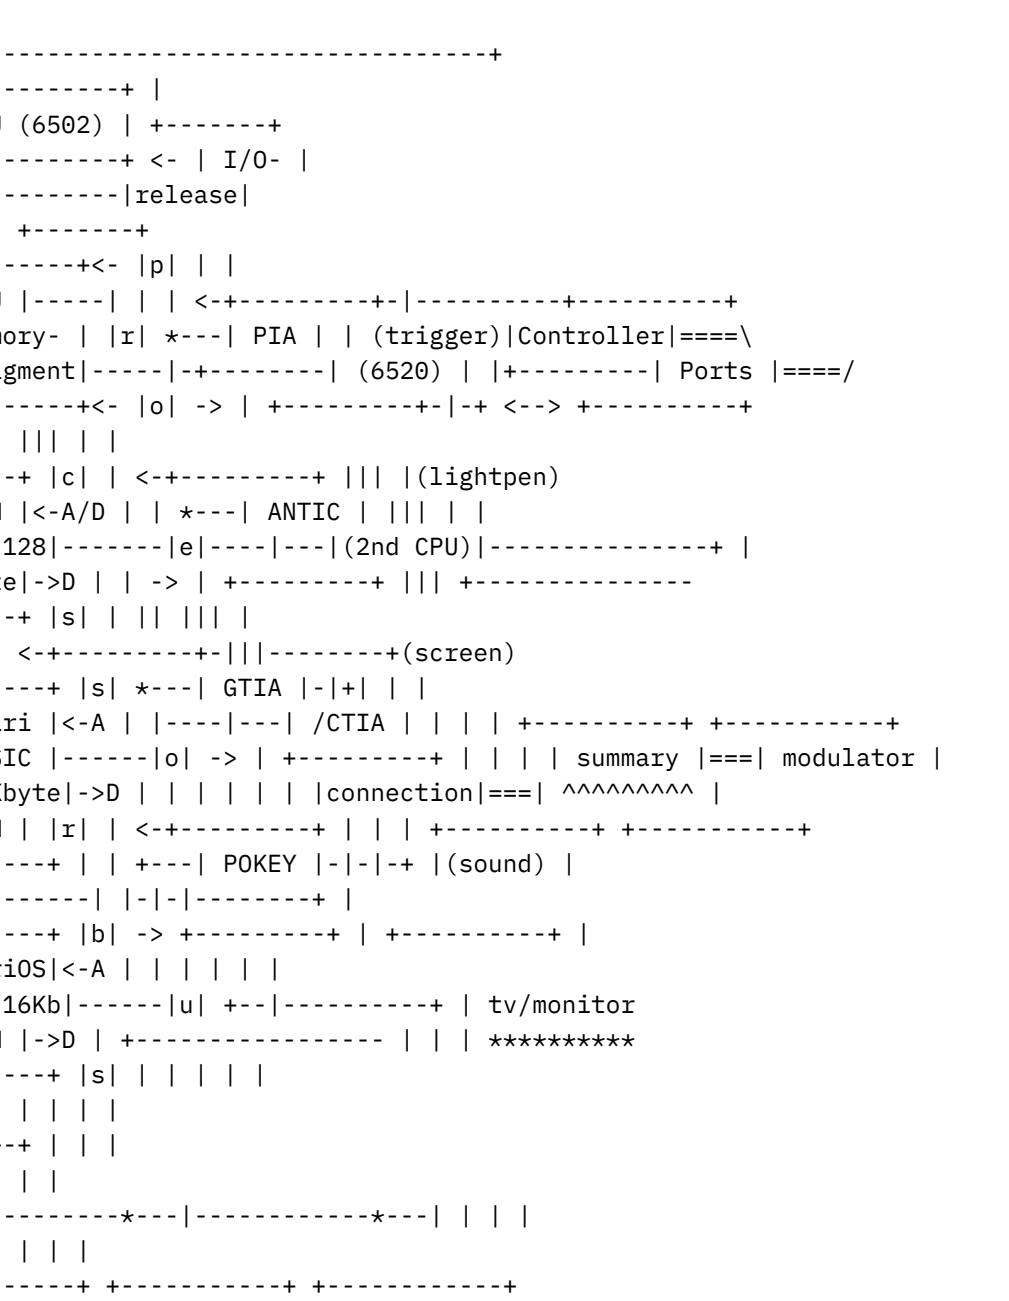
The difference goes something like this: On the Atari, there are two microprocessors, ANTIC and the 6502 or 6502c. To allow them to coexist, ANTIC must shut off the 6502/6502c, a process called DMA. The 6502 supports DMA, but in Atari's implementation, it required 4 chips. The 6502c has this additional circuitry built-in.

More on this from James Bradford, mailto:sup8pdct@mail.cth.com.au :
The 6502c in all PAL atari's, late 400/800, XL, XE NTSC atari's have A special 6502. This 6502 has an extra line called HALT. It is controlled by ANTIC which it uses whenever it needs the data/address bus. The HALT line is on pin 35 of the atari 6502 and must be pulled high for the chip to work (I think) . Early 400/800 NTSC atari's used a standard 6502 and a couple of chips to stop the processor when antic needed the busses

The 130XE and XEGS contain a small additional LSI called FREDDY, a RAM address multiplexer. According to mailto:sup8pdct@mail.cth.com.au (James Bradford), "FREDDY is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDY also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDY but it doesn't have the extended RAM. Even if it did, you would still need

the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDY, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDY for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDY does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDY) and an extra 8 RAM chips."

Hardware Arrangement (With thanks to mailto:peter@soemtron.handshake.de (Thomas Havemeister))



```
|ParallelBus| | Cartridge | | Serial |
|Interface/ | | Slot | |Input/Output|
| Enhanced | | ROM | | (SIO) |
| Cartridge | +-----------+ +------------+
| Interface | | |
+-----------+ | |
| | |
- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos ) - modem
```

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE only

Subject: 1.5) How did Atari get it's name?

Graham Thornton, mailto:dangermouse@prodigy.nospam.net types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are thiers, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the Atari 8-bit family of computers, including the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE and the XE Game System!

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st.

Large binary posts do not belong in unmoderated discussion groups like comp.sys.atari.8bit. If you wish to share PD/freeware/shareware, use alt.binaries.atari and alt.binaries.atari.d or upload the software to the University of Michigan Atari Archive.

To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

Subject: 2.2) What other Usenet newsgroups cover the 8-bit Atari?

news:comp.sys.atari.advocacy
Attacking and defending Atari computers. Unmoderated.

news:comp.sys.atari.announce
Atari related hard/software announcements. (Moderated). Dead newsgroup?
Moderated by Yat Siu, mailto:ysiu@HUGE.Net

news:comp.sys.atari.programmer
Programming on the Atari computer. Unmoderated.

news:rec.games.video.classic
Orphan home video game systems. Unmoderated.

news:comp.emulators.misc
Emulating one kind of computer on another. Unmoderated.

news:comp.emulators.announce
Announcements related to computer emulators.
Moderated by Qualcomm, mailto:emulators-request@qualcomm.com

news:alt.binaries.atari
uuencoded software for Atari computers. Unmoderated.

news:alt.binaries.atari.d
Descriptions/discussions on software posted on alt.binaries.atari. Unmoderated.

news:alt.binaries.comp.atari8bit
uuencoded software just for the 8-bit Atari. Not widely available.

Subject: 3.3) What is ATARIPL?

From: Wojciech Hartman <harti@waw.pdi.net>
Date: Saturday, March 15, 1997 3:51 AM

I am proud to announce that there is a mailing list "ataripl" for all polish-speaking Atari users and enthusiasts.

To subscribe the lists you have to send an email to mailto:majordomo@piwo.bl.pg.gda.pl containing a line "subscribe ataripl".

Subject: 3.4) What is ATARI8-L?

atari8-l mailing list

created especially for discussion about ANIX project (unix for atari8),
but any atari 8bit related threads are welcome. english language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.ideefixe.nom.pl

containing a line:

subscribe atari8-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

there is also mail2news gateway that translates all postings on the list to
easy to read usenet articles, available read-only to everyone at:
news://zwieracz.ideefixe.nom.pl/listserv.atari8-l

the atari8-l mailing list is available as well as a newsgroup listserv.atari8-l
on public newsserver zwieracz.ideefixe.nom.pl .

there is also archive of all postings that appeared on the list (well, in fact
almost all - about first hundred is missing).

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.ideefixe.nom.pl

(There's an old list called INFO-ATARI8 which is actually still alive. But
knowing about it is know longer necessary, as 100% of its postings are cross-
posted with atari8-l.)

Subject: 3.5) What is ATARI8PL-L?

any atari 8bit related threads are welcome. Polish language only.

to subscribe, please mail a message to
mailto:majordomo@zwieracz.ideefixe.nom.pl

containing a line:

subscribe atari8pl-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

if you get any problems, please report to
maciej grzeszczuk, mailto:krap@zwieracz.ideefixe.nom.pl

Subject: 4.0) What is XL Search?

XL Search is a new and growing search engine created and maintained by
mailto:nbs@sonic.net (Bill Kendrick), designed to provide much-
improved access to the various PD/freeware/shareware Atari 8-bit software
archives available on the Internet.

XL Search is located at: http://www.sonic.net/~nbs/xlsearch/

You can also access XL Search via e-mail! Send mail to:
mailto:nbs@sonic.net with the subject "xlsearch" for details.

mailto:nbs@sonic.net (Bill Kendrick) himself writes:

http://shareware.com/ , c|net's FTP-site search engine, now includes
the Atari 8-bit files at UMich!

Unfortunately, being under the previously-existing "Atari" category,
the files are now pretty mixed in with the ST stuff. I've talked to them
about fixing that. No reponse yet (they're really slow that way)...

Anyway, so now you can use http://shareware.com/ to find Atari stuff..
just be careful what directory you pull it out of! :)

Remember, you can ALSO use MY MINI VERSION OF SHAREWARE.COM!....

XL Search, the Atari 8-bit FTP site search engine!
If anything, it's much less cluttered than Shareware.com! ;)

Subject: 4.1) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of
files for many computing platforms, including the Atari 8-bit computers. For
more information:

Bill Kendrick, mailto:nbs@sonic.net (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich
Archive. The Archivists request you use these mechanisms in this order of
preference:

1) The number one way to get into the UMich archives is via AFS. If you have
AFS, all our files are kept in the directory
"/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT!
Specifically, use:

file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software
Archives" choice. Specifically, use:

gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/
Specifically, use:

http://www.umich.edu/~archive/atari/8bit/

Mirror web sites:
http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
http://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory.
Specifically, use:

ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are
several mirror sites which are all updated from the home site regularly:
ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/
ftp://barnone.citi.umich.edu/atari/8bit/
ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
ftp://pmftp.cs.vu.nl/pub/atari8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How can
I retrieve files from FTP sites by e-mail?"

Uploading

General uploading tips:
- No uploads may be made to the Archive's mirror sites.
- Please also upload a short text file describing what your upload is. You
might also suggest what permanent 8bit subdirectory you'd like your file to
end up in.
- Note that the 8bit/New directory is "write-only."

1) upload via AFS:
Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

2) upload via FTP:
FTP to atari.archive.umich.edu, cd into "8bit/New", and upload your files.

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

3) upload via E-Mail:
Simply uuencode the file and mail it to mailto:nbs@sonic.net
(Bill Kendrick).

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by mailto:eyvind@stud.unit.no
(Eyvind Bernhardsen). PVV stands for ProgramVareVerstedet, or The Software
Workshop, a student society at the University of Trondheim, Norway.

ftp://ftp.pvv.unit.no/pub/atari/8bit/ (129.241.210.232)

Uploads go to /incoming/atari/8bit; Eyvind will move them to the appropriate
directory. Please include a readme file with each upload, so people know
what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

A mirror of Kevin Atkinson;s ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Polish Demo Archive?

It's a place when you can get all Polish (not only) demos (not only)
on a Atari 8-bit.
If You have any comments, write to:
mailto:LukSoft@hipokrates.am.lublin.pl

ftp://hipokrates.am.lublin.pl/sys/pub/atari8/

Subject: 4.7) What is the Atari 8bit FTP Archive in Slovakia?

This FTP site contains demos, games, utilities, zines and other useful stuff
from all the world. Also, you can download big amount of slovak and czech
programs for 8bit Atari only from this archive. And finally, because this
site is created and supported by slovak computer group GMG, most of our
products can be found right here.

If you want to place here your program, just send it to me (with some comment) by e-mail and I will do the rest.

If you have some problems or questions, please contact me at this address:

mailto:mchorvat@econ.umb.sk (Marek Augustin Chorvat)

ftp://svs.scsss.sk/pub/atari

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

Internet access to the Cleveland Free-Net (Cleveland, Ohio, USA):

telnet://freenet-in-a.cwru.edu or
telnet://freenet-in-b.cwru.edu or
telnet://freenet-in-c.cwru.edu

Type "go atari" at any menu.

Contact:
mailto:xx004@cleveland.freenet.edu (Atari SIG)

The Cleveland Free-Net now has a home page:
http://cnswww.cns.cwru.edu/net/easy/fn/

Subject: 5.2) What is the National Capital FreeNet Atari Users SIG?

Internet access to the National Capital FreeNet (Ottawa, Ontario, Canada):

telnet://telnet.ncf.carleton.ca (Type "go atari" at any menu) or
gopher://gopher.ncf.carleton.ca or
http://www.ncf.carleton.ca/

Contact:
mailto:ac382@freenet.carleton.ca (Jack Kitowicz) or
mailto:aa728@freenet.carleton.ca (Blair Dea)

Subject: 5.3) What is the Victoria Telecommunity Network Atari Users SIG?

Internet access to the Victoria Telecommunity Network (Victoria, British Columbia, Canada):

telnet://freenet.victoria.bc.ca (Type "go atari" at any menu)

Contact:
mailto:ua558@freenet.victoria.bc.ca (Gordon Hooper) or
mailto:ud264@freenet.victoria.bc.ca (Ted Skrecky)

Subject: 6.1) What is FidoNet?

[NOTE - Michael didn't write this section. If you know who did, I want to give that person proper credit!]

FidoNet is a system not unlike the Internet in that it consists of BBSs linked together. Each discussion group (there are nearly a thousand) may or may not be carried by an individual BBS as the sysop chooses. Discussion groups are called echoes, and each echo must be moderated. There is an Atari National Echo which is 8-bit, and several (I believe) ST echoes. BBSs are also free to have local discussion groups that may or may not be echoed nationally.

To access FidoNet, you need to find a FidoNet BBS that carries the echo or echoes you wish to read, and then abide by the rules of both that BBS and the echo. Some of these BBSs require annual membership fees. Some are supported by voluntary donations. One such that can also be reached by telnet is Doc's Place BBS. I'm not even sure of its location, but I think it's Clearwater, FL. If you're coming in via an ordinary ISP and either Netscape or IE, you simply type:

telnet://docsplace.dyn.ml.org

mailto:krap@zwieracz.ideefixe.nom.pl (maciej grzeszczuk) adds:

all fidonet backbone echoes are carried by zwieracz.ideefixe.nom.pl, and they are available read-only via any newsreader. zwieracz itself (2:480/70, 2:48/70, 2:48/700, 2:2/3009) is the main polish fidonet-internet gateway. i gateway many usenet groups onto fidonet echoamil bidirectionally, so fidonet users here in poland can easily read and post articles. this group is also available at my system via EMSI over TCP or standard modem dial-up connection (emsi over tcp ports are 60177 - for telnet, and 60179 for raw socket).

try url: news://zwieracz.ideefixe.nom.pl/fido.atari and you'll reach national ATARI group.

Subject: 7.1) What is the Atari 8-bit Computer Web Ring?

A WebRing is a set of web pages that have been linked to each other. Basically the first page in the ring has a link to the second one, the second one to the third, the third to the fourth... with the last page linking back to the first. This is all done by adding a small piece of HTML code to your page, which will automatically keep track of where your page lies in the WebRing. In this way pages from all over the world dealing with similar subjects can be linked together. In our case the subject is Atari 8-bit computers, so all pages in this WebRing are about the Atari 8-bit.

The home page of the Atari 8-bit Computer Web Ring is at:

http://www.geocities.com/SiliconValley/Lakes/7953/a8ring.html

and the ring is maintained by Raphael Espino, mailto:rje@co.umist.ac.uk

---

Subject: 7.2) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

Subject: 8.1) What IRC channels discuss the 8-bit Atari?

==> #atari8 - Just for 8-bit Atari users!

Paul Clark offers this tip:

I think Dalnet carries #atari8, do the following;

telnet://telnet.dal.net

At the login prompt, type;

dalnet

If prompted for a password, just hit enter. You should
be able to navigate to #atari8 from there.....

==> #rgvc - Classic Games and Systems Collectors. "Rec.Games.Video.Classic"

mailto:cmwagner@gate.net (Chad Wagner) writes:

If you have access to a Unix host then you should be able to get to irc by
typing irc at your shell prompt and jumping on an EFnet server
(irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there,
and join #atari8 (and hope your on EFnet, :).

If you are using SLIP/PPP then download a client (for Windows users, download
mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if
they have gotten that far -- are familiar with IRC, :) and select one of
the servers and join #atari8. There is many IRC servers on EFnet, chances
are the one your on is on EFnet.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
mailto:audioguy@cheerful.com for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.

ATR - Atari disk image format. Invented by Nick Kennedy,
mailto:nkennedy@cswnet.com for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
mailto:emulators@msn.com for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
mailto:classics@nacs.net for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load
files. Like .xmo, use of .bin is discouraged.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load
file or disk image?

Russ Gilbert, mailto:russg@en.com writes:

The disk image part is a matter of taking a copyable boot
disk and making an atr, xfd, dcm or other disk image type
file out of it, usually for use with an emulator. Before
emulators, the Bob Puff .dcm format was used to
store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy
protected. For boot disks, this usually involved a large
number of special formatting that couldn't be copied using
ordinary sector copiers. Usually the boot process involved
checking to see if a certain sector error occurred, then
proceeding. If the error did not occur, the disk was a copy
and would not work.

For carts, usually the method of protection was to write to
the cart area of memory and see if the value changed. If the
value changed, the cart program was in RAM, not ROM and

would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE Pro system, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just the 'standard' SIO2PC cable. The 'Pro' image can 'capture' the copy protection of an original commercial disk. The 'Pro' image can then be loaded into an A8 using the APE registered version software, thus backing up your original disk software. Note the 'Pro' image will only be of use to person(s) owning registered APE software and 'Pro' adapter cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette image file?

mailto:ernest@pi.net (Ernest R. Schreurs) writes:

For those of you that like ALL classic Atari software, there is now a way to store all software that has been recorded on cassette tapes on the hard disk of your PC. I have written a program that is similar to the SIO2PC utility written by Nick Kennedy. But this one is intended for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free disk space to work with. The sound card should be able to sample sound at a sample rate of 44.100 Hz mono. The sample must be recorded into a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file. The .cas file is a digital cassette image file that only contains the data that is on the cassette tape. Once you have that, you can throw away the .wav file. The .cas files are typically 16 to 64K, so they are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette image) you do not need a sound card. You do need a SIO2PC cable or similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file
format as of version 1.15 of APE. It looks real neat, so try that out
too! Thanks to Steven for adding a nice user interface for these
cassette images. He did a nice job. I am hoping other using are
willing to write some programs to get more enjoyment out of this
underrated storage medium.

My stuff is available totally free for personal use, so I hope you
enjoy it. Read the docs about the conditions.

Keep those XL's/XE's humming.
If you have any questions feel free to E-mail me: mailto:ernest@pi.net

---

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel, mailto:itayc@hotmail.com
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.geocities.com/Hollywood/Lot/4205/

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80

File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

MyUTIL and the XF551 - tips from mailto:JTKIRK@urp.edu.pe:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz, mailto:draco@mi.com.pl answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on

either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo, mailto:ssilicon@lax.net sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:crow@cs.dartmouth.edu (Preston Crow),
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 11.5), can be used to read/write to a hard drive connected to an MS-DOS system. This can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the companion vendor/developer list) allow the Atari XF551 disk drive to read 720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software Services (see the companion vendor/developer list), allows both low density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard floppy drives to be used on the Atari. A utility is included to read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a
male DB9 to male DB25 modem cable to connect to your
modem. So why not use this cable as your null modem
cable as well?

For higher speed connections, above about 9600 bps on the
8-bit, you need the flow control lines. You also need
a Multi I/O or Black Box, which use the PBI (parallel bus),
then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C
port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 11.5) What is SIO2PC?

From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC
compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari
programs could be stored on the PC's hard (or floppy) drives. It turned out to
be quite successful. About 95% of my work was in the software, but a hardware
device to convert logic levels was also necessary. This device is now commonly
referred to as an SIO2PC cable.

Features:

Emulates 1 to 4 Atari disk drives

Store your Atari files on PC hard or floppy drives

Boot from the PC, real drive not needed to start-up

No software or drivers required for the Atari;
no conflicts: use your favorite DOS

Twice as fast as an Atari 810 drive and more reliable

Co-exists with real drives in the Atari daisy chain

Compatible down to the hardware level: use sector copiers, etc.

Print-Thru captures Atari print-out and routes to PC's printer

Convert Atari files to PC files and vice versa

1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy

SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- UltraSpeed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- UltraSpeed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 67000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2001 "California Access"
SS SD/ED/DD 19200 bps or 38400 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2002 "California Access"
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB

= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: MYDOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- UltraSpeed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades (CSS)
- Floppy Board (CSS)
- Percom drive upgrades

==> Atari XF351 or XC35
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

For starters, you'll need to obtain one of the following interfaces:

==> Corvus hard drive (10 megabytes)
Rare.
Fast but still relatively slow I/O, kludge through joystick ports for 800.

==> KPI Hard Disk Drive Interface (formerly Supra)
from K-Products (bobkla19@mail.tcd.net - Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (ftooned@crl.com - Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.
Printer and modem, modem will handle 19.2K bps

==> Black Box
from Computer Software Services (CSS) (mailto:audioguy@cheerful.com - Bob Puff)
Will handle all SCSI drives. Allows 9 drive access for MYDOS. Currently the
only modem interface with CTS/RTS hardware flow control. 19.2K ready.

==> SWP ATR-8000
Rare daughterboard for hard drives.
I/O is probably fairly slow on this baby and there may be DOS restrictions.

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors
o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43
- Emulation mode, back sequence (R): 28
- Emulation mode, random sectors (R): 13
- Emulation mode, same sector (R): 29
- Emulation mode, DOS file (W): 7
- Emulation mode, DOS file (R): 36
o Booting from any partition (on the standard XL OS)
o Write protection capability
o 8 jumpers to set the device number for the operating system
o Sweet 16 compatibility

==> Fine Tooned Engineering Multi I/O II
An IDE interface. Released?

==> MSC IDE-Harddisk-Controller
created by Steve Birmanns and Matthias Belitz in Germany
mailto:stefan_birmanns@ac.cybercity.de
mailto:matz@kawo2.rwth-aachen.de
http://www.kawo2.rwth-aachen.de/~matz/atari/
* real device for the parallel-port of the Atari XL-Series
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at

one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* access of ATAPI-CDROM with additional software

Subject: 12.4) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Television:
You'll need a video cable (not detachable on the 400/800), and a TV Switch Box. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus separate chroma (color) and luminance (brightness) signals which the best composite video monitors can take advantage of. Popular examples of such monitors include the family of monitors produced by Commodore.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only be used with a TV.

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\luma signals

-the 600XL, 800XL and 1200XL lack separate chroma signal (can be added via hardware modification)

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

The pinout of the Monitor port is in the pinout section of this FAQ list. The monitor connector on the back of the Atari can be utilized using a 4-pin DIN to RCA converter. You don't need to build a separate cable.

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

"The best monitor for an Atari 8 bit that is readily available today would be a television with an S-video input---these tend to be large and high-quality, so the s-video input is the deciding factor there. You'll have to build the cable yourself, and if you have an XL you'll want to do the Super Video upgrade that Ben Poehland published in Atari Classics a few years ago---this puts the chroma signal back on the pin that it should be and cleans up the video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are cheap-to-reasonable when you can find them."

mailto:bryede@emi.net (Bryan Edewaard) writes:

"Yes, the best choices are monitors that support "Separated Video"
(sometimes called Commodore video on Commodore monitors), or S-Video.
These monitors have separate color and luminance video inputs, which
give a sharper picture without cross-color artifacts - such as the
colored fringes on text when viewed on a TV (although some games use
these artifacts to get additional colors). If you have an XL
computer, then it needs an upgrade to support these monitors due to
the omission of chroma from the monitor port. the 800 and XE
computers don't have this problem.

The 2nd best choice is a TV or monitor that has a "Composite Video"
(usually called just "Video" or "Aux") input. This is a signal that
has the color and luminance information combined into one signal. The
picture will be a little less sharp, but still much better than using
the "Channel 3" output.

>Where might I find one?

I've seen them a flea markets, garage sales, swap meets, ham fests,
and in newsgroups like this one. Plus, many new TV's support S-Video
and Composite video inputs.

>What are the advantages of using one of these rather than a TV?

Well, it's all a matter of how many stages the signal must go through.

1. The Atari generates video as a color signal and a brightness
(luminance) signal. These are passed to the monitor port as Chroma and
Luma signals (XL's have no Chroma output from the factory).

2. The signals are mixed together to make a standard video signal
which is also passed to the monitor port as Composite Video.

3. Then the mixed video signal (along with audio) goes through the
process of being "modulated" into a TV radio signal (channel 3 or 4).
This step involves removing high frequencies from the video (blurring
it) and sending it to the TV in a fragile broadcast form that's
suseptable to all kinds of interference. Then the TV must (1) extract
the video signal from the radio signal, (2) separate the Chroma and
Luma components as best it can, then (3) divide the Chroma in R, G,
and B. Any of these steps that you can eliminate will help your
picture.

>Are there any other composite video monitors that anyone would recommend
>(and where might I find one)?

Maybe the 8-bit FAQ mentions these monitors. The most common one is
probably the Commodore 1702 which has a very good picture and is quite
reliable.

If you plan to use an XL (which I do), upgrading the video circuitry
makes as big a difference as what monitor you choose. Ben Poehland has
some excellent articles in Atari Classics magazines for improving the

quality of the XL's video, as well as restoring the missing Chroma output."

Lonnie McClure mailto:lmcclure@ibm.net has the last word on Commodore monitors:

Comodore models: 1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**.

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

Jerry Jessop, mailto:jjessop1@home.com explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks.

SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based
and includes many additional features. SpartaDOS 3.3a and 3.3b were rewritten
by Stephen J. Carden for use with BBS Express PRO!. SpartaDOS 3.3c is
produced on disk or in a 16K ROM cartridge from K-Products.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete
compatibility with existing software, and then choose either SpartaDOS or MYDOS
as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the
archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
BW-DOS 1.30 and all other versions are available via:
http://atari.boss.com.pl/files

Any other versions of DOS all 8-bit Atari users should be aware of??

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Home Computer (1979) 8/16K, membrane keyboard, 400/800 OS
800 Home Computer (1979) 8/16/48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS

1250XLD Earlier name for the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives (controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE/AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80 col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor

XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the European data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have.

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz

Subject: 13.5) What BBS software can be used on the Atari?

This section mostly by mailto:winston@merk.com (Winston Smith)

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was

the first to support a RAMdisk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in Atari BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first Atari 8-BIT BBSes that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an Atari "very long string" (for which Atari BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of the commercial BASIC XE cartridge to run. This BBS program was very popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SpartaDOS environment. This was a problem until very recently, when the disk-based version of SpartaDOS was re-released as shareware. This BBS program uses a "modem clock string" rather than an R-Time 8 cartridge in order to retrieve the current time. It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes). FOREM-XE BBS is still currently in use as we speak, and may be reached via the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS, which is the Keith Ledbetter companion project of the EXPRESS!-TERM terminal program of days gone by. I am not familiar with this program. I think that it is written in Action! and only supports XMODEM Checksum transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE-- demo version of the OASIS BBS program. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". This OASIS demo module comes with an excellent message system. The OASIS file system is one of the most complicated that I have ever seen. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). There is a commercial version of OASIS called "OASIS IV" that performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

o Carina BBS -- a shareware product of Shadow Software.

o BBS Express! Professional -- a product of K-Products. See Vendor List.

o OASIS IV -- a product of ???

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

Subject: 13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?

Atari BASIC:

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga, mailto:F.Offenga@student.kun.nl adds:

there's another good answer (IMO):

You can also take a look at the part numbers on the IC's inside your Atari and compare them with the numbers from the following table:

Part#	Version
CO12402 + CO14502	A
CO60302A	B
CO24947A	C

CTIA or GTIA installed?

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Subject: 13.7) Which versions of the Operating System (OS) are there?

This section written by Freddy Offenga, mailto:F.Offenga@student.kun.nl

The following Operating Systems exist for the Atari 8-bit:

Rev.	System(s)	Models	Size	Part Nr(s)
A	NTSC	400/800	10kB	CO12499B, CO14599B, 12399B (*)
A	PAL	400/800	10kB	CO15199, CO15299, CO12399B
B	NTSC	400/800	10kB	(?)

B PAL 400/800 10kB (?) (*)
1 A NTSC/PAL 1200XL 16kB CO60616A, CO60617A
1 B NTSC/PAL 1200XL 16kB CO60616B, CO60617B (?) (*)
1 NTSC/PAL 600XL 16kB CO62024
2 NTSC/PAL XL/XE 16kB CO61598B
3 NTSC/PAL XE 16kB C300717
4 NTSC/PAL XEGS 16kB C101687

(?) more information or confirmation required

(*) these versions should exist, although I've not seen them.
If you have one (or more?) of these, please contact me.

NOTE:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).

Alan Manuel K. Gloria, mailto:mani@pworld.net.ph adds:
Revision B on the 400/800 does exist -- it is referenced to a lot in
Mapping the Atari by Ian Chadwick, and is used on most Translator disks
for the XL/XE

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

contributors to this section:
mailto:jlodoen@shell.portal.com (Jeff M Lodoen)
mailto:olavese@online.no (Vidar \"Hawk\" Olavesen)
mailto:pmulvey@erols.com (Pat Mulvey)
mailto:sposey@ioa.com (Steven E. Posey) (Party Quiz controllers description)

The following games support 4 player head-to-head play. Remember, only the
400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor,
Thorn EMI Soccer, Major League Hockey

The following support 8 players on the 400/800 or 4 on the other computer
models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button keypad
controllers linked together with RJ-11 jacks (standard phone jacks) to a
box with
2 joystick port connectors.

Party Quiz by Suncom

Subject: 13.9) Why should I disconnect the 810/1050 power supply before
connecting or disconnecting SIO cables?

Rich Mier writes:

You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

Subject: 13.10) What is Omnimon?

--This section was written by Scott Charles, mailto:scharles@blast.net

Omnimon is a add in board for the Atari 400/800 series of computers and a replacement OS chip for the xl/xe series of computers. The original Omnimon board fit onto the OS board in the 800 series and had a switch attached to it to disable the board. The 400 series required you to bend the circuit board into a right angle for it to fit inside the 400's case. (It was designed to do this.). The Xl/Xe version replaces the OS Rom chip inside the computer with one that contains the Omnimon code, and a revised OS to make the XL more compatible (no translator disks needed).

Omnimon itself is a machine language monitor residing from $C000-$CFFF, with a few variations. It was designed in 1981 by David C. Young (who also wrote Cartcopy, a copier for the right slot of the 800) of CDY Consulting in Texas. The first software revision of Omnimon had a few basic commands and was only 4K long, only for the 400/800. The second revision required the addition of a bank select switch, and was 8K long. Since it was addressed by the 400/800 as 4K, when you needed to use the code in the other bank, all the text on the screen flips upside down, you flip the switch and hit any key. The Xl and Xe versions of Omnimon do their bank selecting through the normal XL port for this function, so it is seamless.

So what can you use Omnimon for? Its main claim to fame is its ability to interupt any running program by pressing and holding the SELECT-OPTION-RESET keys. Depending on the sequence you press determines what kind of warm boot the Atari does. SELECT+RESET does NO warm boot, preserving the stack and flag values of the 6502. OPTION+RESET allows a warm boot (as if you had just pressed RESET) and interupts the vector at $C (initialation vector).

I think you can see where we are going with this - Omnimon was developed as a machine language developer's tool, much in the same way that the Happy modification was developed for legitimate backups. I.E. far more people use both products for software piracy. If you have an Omnimon! in your machine

and you try to boot up an Electronic Arts program, for example, you will get a message that says "REMOVE ROM AT $C000", and the program hangs. (Hence,the need for the disable switch on the 400/800 version. There is no way to disable the xl/xe version, just switch it to an alternative OS.) The 400/800 version, since the disable switch just deselects the mapping of Omnimon to $c000 area, can be switched on and off at will.

I myself did not know what Omnimon was used for until I was using a sector editor on a program called Pharaoh's Pyramid, from Master Control Software. On it is a sector that reads, "REMOVE OMNIMON YOU DIRTY PIRATE". This got me to thinking, what does that mean? After about 5 months of playing around with the Omnimon board, I figured out how to use it to pirate software. In fact, it can be used to make most boot disks into binary files, and remove copy protection from countless more.

At the risk of sounding melodramatic, I can safely say that Omnimon hastened the demise of the Atari 8 bit computer by 2-3 years, because of its power.

Subject: 13.11) What is the difference between NTSC and PAL machines?

Software written for NTSC (North America) will always work on PAL machines, but software designed on PAL machines (Europe) won't necessarily work on NTSC machines.

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they refresh the screen 50 times a second doing 1/2 the lines each refresh so they effectively repaint the screen 25 times a second. NTSC is 525 lines/screen with a 60 times a second refresh - again only half the lines each refresh so a 30 times a second frame rate. This would change the amount of time available during vertical sync pulse, and the number of lines that need to be redrawn each time.

Graham Thornton, mailto:nero@chicagonet.net adds:

I use both a real PAL Atari 800 and a PAL-ANTIC 1200XL here in the US.

Replacing the ANTIC chip with a PAL version changes the screen refresh rate to 50Hz which allows most of the PAL-only European software to run. Your system will still report itself as a NTSC machine, unless you change the ROM (see the Nir Dary upgrade), but most software doesn't care.

The one problem you might run into is your monitor. Replacing the ANTIC will mean your North-American Atari is now generating an NTSC signal at 50Hz, instead of the usual 60Hz. Some people will tell you that modern TVs and monitors don't care but that isn't actually true. My brand-new Sony Trinitron 15" colour TV/monitor goes bezerk with the upgraded 1200XL, but my 15-year old 10" Texas Instruments color monitor (designed for the

TI-99/4A) is fine.

You can also use real European equipment here in North America, provided
that you have a PAL-compatible TV/monitor. The frequency of the power
system is irrelevant, as I use my 800 with a 110V/60Hz 1050 power supply.

Subject: 13.12) Is the software for the Atari 8-bit computers "TV-standard
dependent?"

{some PAL demos flicker, or won't run at all on NTSC machines}

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

This is because PAL machines have a vertical refresh frequency of 50hz
(NTSC use 60hz) which translates into more vertical blanking time for
demos and other computation-intensive graphics software. So PAL demos
that won't work on NTSC machines are usually returning from a VBI
(vertical blanking interrupt) too late. Some also attempt to use more
vertical resolution ("longer" display lists) than an NTSC display can
handle.

mailto:thor@math.tu-berlin.de (Thomas Richter) adds:

Yes, it is. Mostly because the frequency of the vertical blank interrupt
is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough
to notice the difference, so all system timings like the keyboard auto-repeat
function depend on the TV system. These parts of the OS have been corrected
with OSB and the XL versions of the OS. However, as most games install a
VBI, their timing does still depend on the frequency -> they will run
slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the Antic-F
(Graphics 8) mode are not colorful at all when displayed on a PAL TV, because
of differences in the color encoding for the TV. The schematics of
the Xl computers include however a hack how to change the PAL version to
the NTSC version (the PAL versions include two crystals, one with 5/4th of
the frequency of the other. One is used for the system clock, the other for
the color clock), but I never dared to apply it.

Subject: 13.13) What programming languages are available for the Atari?

Revision : 1.0
Date.... : 4/20/1997

```
================================================================
!!!! This section is under construction - HELP WANTED !!!!
----------------------------------------------------------------
```
The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include;
title, last version, author, date and a short description.

It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- Assembler Interchange Format, Project description
Version 2.2, 2-2-1997, Freddy Offenga

If you like to help or if you've something to add already,
just contact me. There's still a lot work to be done....
Freddy Offenga, mailto:F.Offenga@student.kun.nl
==========
There are quite a lot! To get some structure in this section it's
divided into the following catagories;
a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

[D] = available on disk
[C] = available on cartridge

a) ASSEMBLER
- 130XE+ Makro Assembler v2.2, 1992 (Torsten Karwoth) [D]
Two pass 6502 assembler/editor. Supports extra RAM.
Highly compatible with Atmas II.
- Alfasm, Version 1.0, 1990 (Jeff Williams) [D]
Supports 65816 instructions (for the Turbo-816 upgrade
from DataQue Software). This assember is also known as
the Turbo-Assembler/16.
- Atari Assembler/Editor, 1981 (Atari) [C]
Two pass 6502 assembler/editor.
- Atari Macro Assembler, 1981 (Atari) [D]
Two pass 6502 assembler/editor.
- Atmas II Makroassembler, 1985 (Peter Finzel, Hofacker) [D]
Macro assembler with integrated editor and monitor.
- Bibo Assembler, 1986 (Compy-shop) [D]
- Datasm/65 assembler, Version 2.0, 1981 (DataSoft) [D]
Two-pass 6502 assembler.
- EASMD, Version 1.0, 1981 (OSS) [D]
- LADS, written by Richard Mansfield of COMPUTE! (for Commodore computers)
and ported by Charles Brannon to the Atari, is a very good 2-pass
assembler supporting assembly from memory AND disk [D]
- MAC/65 Macro Assembler, 1982 (OSS) [D/C]
Two pass macro assembler/editor.
- MAE, 1996 [D]

Supports 6502 and 65816 mnemonics.
- Nasm65 assembler, 1992 (Nat!) [D]
Highly portable cross assembler (written in C). Initially
made for the Atari ST. Highly compatible with MAC/65.
- PC-65 Assembler, Version 1.0 beta, 1996 (Jan Feenstra) [D]
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.
- Synassembler, 1982 (Steve Hales, Synapse Soft) [D]
Two pass 6502 assembler.
- ST-65 Assembler, 1991 (A. Stauffenberg, F.Offenga) [D]
A cross assembler for the Atari ST (written in 68000 asm).
- 6502 Cross-Assembler "xa", 1997 (Andre Fachat) [D]
written in GNU C.

b) BASIC
- Advan BASIC Compiler (Advan Language Designs)
- Atari 800 Basic, Version 1.0, 1981 (Microsoft) [D]
- Atari BASIC, Rev.C, 1983 (Atari) [C]
- Atari Microsoft BASIC II (Atari) [C]
- BASIC A+, Version 3.05, 1981 (OSS) [D]
- BASIC XL (OSS) [C]
- BASIC XE, 1985 (OSS) [C]
- Turbo Basic XL (Frank Ostrowski, Happy Computer) [D]
Interpreter, Version 1.5, 1985
Compiler, Version 1.1, 1985

c) C
- ACE C (John Palevich & Ralph Walden) [D]
This is a newer version of 'Deep Blue C'.
- C/65, Tiny C (OSS)
- C65
- CC65, 1989 (John R. Dunning) [D]
This public domain package includes; compiler, linker,
assembler and object librarian.
- CC8
- Deep Blue C, Version 1.2, 1982 (John Palevich, APX) [D]
Drawn from Ron Cain's public domain C-compiler.
- DVC C, Version 1.01, 1985 (Ralph E. Walden) [D]
- LightSpeed C, Version 1.08, 1986
(Clearstar Softechnology) [D]

d) PASCAL
- Atari Pascal, Version 1.0, 1982 (APX-20102) [D]
- Draper Pascal, Version 1.5, 1983 (Norm Draper) [D]
- Kyan Pascal, 1986 (Kyan Software) [D]
Package includes; compiler, linker and assembler.

e) LISP
- INTER-LISP/65, Version 2.1, 1981 [D]
(Special Software Systems, DataSoft)

f) FORTH
- ValForth (Valpar International)
- Extended fig-Forth (APX-20029)
- fig-Forth, Version 1.1 [D]
- fun-Forth (APX-20146)
- Grafik-FORTH
- QS Forth (Quality Software)

g) PILOT
- Atari PILOT, 1980 (Atari) [C]

h) LOGO
- Atari LOGO, 1983 (LCSI, Atari) [C]

i) All the rest
- Action!, 1983 (OSS) [D/C]
- Quick, Version 2.0, 1990 (Raindorf Soft) [D]

Subject: 13.14) What is the Atari XEP80 Interface Module?

This section written by: mailto:raukamp@dame.de (Thomas Raukamp)

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from mailto:david_p@storm.ca (David A. Paterson)

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application

that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you
can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 13.15) What makes some XL/XE software incompatible with the 400/800?

Konrad M.Kokoszkiewicz, mailto:draco@mi.com.pl writes:

XL/XE software won't work on 800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 13.16) What games run only on the 400 and 800 models?

The following are reported as incompatable with models other than the original
Atari 400/800. Most probably do work on XL/XE's if you use a translator to
run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund
Aquatron Sierra On-Line

Subject: 13.17) What games make use of the Light Gun?

mailto:jmouchmino@aol.com (Bertrand M. (LEXX)) writes:

Bug Hunt, Barnyard Blaster, Crossbow, Crimebuster, Operation Blood, Operation Blood II - Special Forces (not completely sure about that one), Light Gun Blaster (PD), Gangsterville (Italian game written in BASIC), maybe a couple more...

Bertrand M. (LEXX)

Subject: 13.18) How do I type a tilde (common character in Web URL's) on my Atari?

The Shadow, mailto:The_Shadow@spnt.com writes:

The question is: "How do I type the tilde or squigly line which is in most web addresses? I don't have a key for it..."

Answer: The tilde is an inverse backspace on the Atari 8-Bit which can be very hard to type depending on the term program you are using, however you can insert the hex equivalent very easily, which is %7e in place of the tilde and it will work just perfectly. Do not put a space either before or after the %7e.

I (Michael) add:

Some advanced Atari software supports the tilde character natively. E.g., you can type a tilde in Ice-T with the Atari Logo/Inverse Video key.

Subject: 13.19) What's the difference between ASCII and ATASCII?

David Moeser -- erasmus att iglou dott com -- produced this nice translation table.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)
==

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List." Available via:

http://www.faqs.org/faqs/atari-8-bit/vendev/

and Usenet FAQ archives everywhere.

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

---

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

Trevor Holyoak, mailto:trevor@holyoak.com maintains the "Atari BBS List."

http://www.holyoak.com/atari/

Subject: 14.3) Where is my nearest 8-bit Atari user group?

Rich Tietjens, mailto:atari@teleport.com maintains an Atari computer user group list at:

http://www.teleport.com/~atari/ugbbs.htm

Subject: 14.4) I'm new to the Atari. How do I use this thing?

"The Atari 8-bit New User, Emulator Help FAQ" is maintained by
mailto:nbs@sonic.net (Bill Kendrick). Bill and his FAQ are
excellent sources for information on basic usage of the 8-bit Atari, and for
information on the 8-bit Atari emulators which run on other computing
platforms.

See: http://www.sonic.net/~nbs/atari/info/emulatorfaq.html

If you'd like a text-only copy, simply send e-mail to
mailto:nbs@sonic.net with the subject:

send emulator faq

Subject: 14.5) Can I use an emulator to run my old Atari software on my new
computer?

"The Atari 8-bit New User, Emulator Help FAQ" is maintained by
mailto:nbs@sonic.net (Bill Kendrick). Bill and his FAQ are
excellent sources for information on basic usage of the 8-bit Atari, and for
information on the 8-bit Atari emulators which run on other computing
platforms.

See: http://www.sonic.net/~nbs/atari/info/emulatorfaq.html

If you'd like a text-only copy, simply send e-mail to
mailto:nbs@sonic.net with the subject:

send emulator faq

Subject: 14.6) What hardware upgrades, modifications and add-ons are available?

The Atari 8-bit Hardware Upgrade, Modification and Add-On FAQ is maintained by
David A. Paterson, mailto:david_p@storm.ca or see:

http://www.geocities.com/SunsetStrip/Alley/1878/hard_faq.htm

Subject: 14.7) What is the HARD-Interlacing-Picture (HIP) format?

HIP is a new method to displaing pictures on small atari...

HIP stands for HARD-Interlacing-Picture and was found by
Members of HARD Software, Hungary in June, July 1996...

It enables to display 160 x 240 Pixels with 30 shades without
nearly all flickering (depends on the source-picture you use)...
HARD stands not for HARD or HEAVY Interlacing, just for the
inventors...

For more information, see the HIP-FAQ, located at:
http://www.uni-karlsruhe.de/~Marek.Tomczyk/Atari8/hipfaq.html

or contact HeAvEn at mailto:nadkar@fh-pforzheim.de

Subject: 14.8) How do I access Usenet, FTP, Gopher, and WWW by e-mail?

The Accessing the Internet by E-Mail FAQ is maintained by "Doctor Bob" Rankin, mailto:BobRankin@MHV.net or see:

http://www.faqs.org/faqs/internet-services/access-via-email/

In the sacred domain of comp.sys.sinclair didst Doctor Clu <clu-da-bard@geocities.com>
eloquently scribe:
: As for no binaries.. tell you what, next time I post a pic I'll warn in
: the message title so you can skip over it. Sound fair enough? Sorry
: for the lack of warning last time.

Nope. Some of the groups you're posting to have a strict NO BINARIES policy,
and quite rightly.

That's why the alt.binaries.* groups exist.

If you want to post a binary, post it to one of them, and then point us to
it, or put it on a web site and supply the URL.

And no, I am NOT going to real out all the reasons for not posting binaries
again. I'm sick of repeating myself.

Check dejanews.

Nonsense! It's looking real good! I love the use of the 8-bit Truetype
fonts -- they make the site come alive. The pages are well-designed and
the links are ones I'd follow.

I wonder, however, if the feedback form is overkill? A lot of guys just
don't want to give out their mailing addresses and phone numbers. I
realize the form isn't working at present, but you might want to think
about taking some of the fields out.

Actually the 800 and XL series do not have the same monitor jacks.
The 600XL does not have a monitor jack at all. I don't know about the
1200XL but the 800XL is missing I believe the the seperate chroma
signal. It is in the machine but you need to do a small mod to get it
to the pin on the jack. The 130XE I think is already set up with all
signals and presumabley the 65XE?

Bo, do you have the SPartaDOS Construction set docs? This combined with the addendums with SpartaDOS X should provide all the info you need. If you do not have them I could scan them in for you, or at least the technical section which covers these issues.

But they erased all traces of the old TARDIS.What about the roundels?
You can't very well leave *THOSE* out!
And #2 control room was much smaller.They shouldn't've gotten rid of the
white corridors.Why not just use a replica of the old #2 set if they
meant for that to be the second console room.Why mess with it?

They never say that in the movie.
They simply call it the "Eye of Harmony".

> > And why does gravity let you walk through windows?

So that's why a window that's otherwise standing straight lets people pass through it.I'd like to know what kind of molecular change would do that and not kill everyone & shatter the glass and all.I mean why don't they fall through the floor.

Message-ID: <3696cff2.33468887@news.demon.co.uk>
Source record: 56712

Sorry folks to break the Dr Who trend <spit>

I can't remember if the Atari 400/800's could be made reset proof. I know the XL's could by setting one location with a 1 or a 0 and pointing another location to the code run address.

I'm sure they could...

The reason I ask is that all the versions of the A800 emu do the same, if you find a reset proofed program in XL mode and hit F5 it just reruns the program and does not reboot. Try the same thing in 800A or B mode and reboot..

Just trying to see if its my poor memory on the coding front, plus I can't find my Mapping the Atari to check it out. Don't want to bother Rich with a small item like this...

Actually, Atari's assests were sold not to long ago to Hasbro
Interactive for a measly $5 mil. That is true about Jack Trammil, but
there biggest mistakes were bad or NO advertising, nearly TOTALLY
dropping support of the ST series in the US, and not allowing the system
multi OS support (like you can get NeXTOS, OS/2, or UNIX, etc... on
Pentium based machines, you don't HAVE to have Windows 95) to open up
the already MicroSoft and Apple dominated market.

Hey, just to take this off-topic thread a little more off topic,
I'm having trouble remembering who all the Doctors were. Not
least coz I was too young to remember the first, and partly
because I becam disillusioned with the whole thing after Tom Baker
regenerated. *snif* :-)

So who was the first doctor?...

I can remember:

2 - Patrick Thornton
3 - John Pertwee
4 - Tom Baker
5 - Peter Davidson

...I don't know who were the rest... (I thought number 6 was
a cheap Tom Baker pretender and gave up on the program...) :-)

So... c'mon! Let's get even further off topic. :-)

Nathan.

Likewise Procomm Plus 32 and a bunch of others that were written around the same time. Procomm also includes fax software, a Web browser based on IE3 (really terrible, BTW,) an FTP module, an E-mail reader and a news reader with kill-file capability. Right now, I have only the terminal and the fax installed, because although the Telnet, FTP, mail and news proggies are good, the Web browser isn't and if you want to install one, you have to have them all. It's a waste of real estate. But the term program offers a tremendous number of features, and they can be configured per entry in the list, or globally.

Wow! You need to protect yourself better than that! I learned my
lesson the hard way. I used to do the same thing you do -- just dump
the whole mess and look at it later -- until one day I downloaded a
50MB spam-bomb. Since I didn't even have a tenth of that space
available, it screwed up the whole download and locked up the
computer. When I discovered it some few hours later, the modem still
had a live connection to the ISP. If I were paying by the minute like
you probably are, I would have wasted a small fortune. Nowadays I
check the xover headers for size. Anything over 10kB has got to be
awfully good before I touch it.

Page 6 are still in business, and still publishing the mag, so you shouldn't
really start posting .atr's of these disks around!

They sell back-issue coverdisks for a very reasonable price (but of course
you need a real Atari & disk drive).

Phone them on 01785 41153 (UK number).

They're one of very few people still supporting us so do things the right
way and send them an order!

Date: 1999-01-04 00:00:00 UTC
From: Guy Bolton King <guy@birchcrown.demon.co.uk>
Message-ID: <369102F0.F0C4A195@birchcrown.demon.co.uk>
Source record: 56596

Last posted this 2.5 months ago, but prospective buyer vanished into thin air, and I didn't keep any other replies, so here it is again:

For sale:

- Atari 130XE
XC11 Tape drive
1050 Disk drive
Joysticks (1 Kempston, 1 obscure nasty thing that looks like a tap)
Star Raiders Cartridge!!!
Tons of games, many in orig. boxes w/instructions.
Manuals:
Mapping the Atari (Compute!)
De Re Atari (Atari Program Exchange)
Hardware reference (Atari)
OS Source Listing (Atari)
Misc. Basic programming books.

- Atari VCS games console
Games cartridges: Ms Pacman, Pole Position & the ubiquitous Combat cartridge.
1 Joystick (rubber handle cover missing, but otherwise works fine).

All in full working order.

Buyer collects/pays shipment from Edinburgh, Scotland. Make me an offer...

Guy Bolton King

113. Microbits SIO to Centronics gizmo

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-04 00:00:00 UTC
From: Greg Menke <nospam@erols.com>
Message-ID: <wklnji26jp.fsf@pop.erols.com>
Source record: 56598

Hi all,

My dad is using 2 Atari 800's to operate his seismograph and prints via a "CARD?/AT Printer Interface" by Microbits Peripheral Products. It just bit the dust, so we're looking for a replacement before we go to the trouble of coding one up with a uController. Inside it has a single monolithic microprocessor of uncertain lineage- the program is presumably contained in ROM internal to the device.

If anyone has a replacement uChip or even another unit, please post. We'll be happy to pay a fair price.

Thanks,

Gregm

114. Atari 8 bits for sale

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-04 00:00:00 UTC

On the directions of the boss I have to clear some space, so I have quite a lot of surplus items, including the following, 800, 800xl, 600xl, 65xe, 810, 1050, 410, 1010, XC12, 30 cartridges, 150 original tapes, lots of books. Some items are boxed, e-mail for a written list or let me know what you are looking for. Swaps welcome as I am not leaving the 8 bit scene. Dorset, England.

Nathan Wain entertained comp.sys.sinclair with the following story:
>Just go to http://www.caverock.net.nz/~nathan/gallery/gallery.html
>The link should be *quite* obvious. :-) And, y'all be pleased to
>know, this one should be viewable on *all* browsers... I actually
>test everything with Lynx, believe it or not.

Tut. The "Horizontal bar" images are not found on the server, and I suspect the background image went that way too. You forgot to specify a background colour so it comes up in light grey and the white text isn't all that visible. Oh, and the word "its" is misspelled... :-)

: insist one one big package in light of that?

Yes, I have no doubt the Floppy board would go by itself. The Black Box, I am not so sure about. The floppy board was meant to be the incentive to buy the whole thing. Someone told me that Bob currently has them in stock. Last time I checked, they were not in. I am sure he has some runs made periodically. However, if no one wants my BB FB, I ll just keep it. No big deal.

Well it's not Colin Baker's fault.He didn't want to dress in that
multi-coloured outfit.Where as the other Doctors were allowed more control
of their part.

> Nope. He was FIRED. He wasn't even allowed to take part in the regeneration
> scene. They had a stand in. He just bumped his head, and then his face was

TJ Edmister <Damage_X@hotmail.com> wrote:
> thanks guys, but how about getting a copy? is it commercial or PD?

> and no the NES has 32 columns of characters (each assigned to 1 of 4 2-bit palletes)

But two screens of 32-columns can be put side-by-side or on top of each
other.This allows scrolling horizontaly or verticaly.RAM in the cartridge
can allow in all four directions.So lots of games show more than 32-columns.

And you can only choose the palette for each 2x2 block of characters.
And you're only choosing 3 colours since the background colour is the same
for the entire screen.And each of the 8 sprites is one or two characters tall
and can choose from one of the four 3-colour palettes as well.
(with the "background" colour being transparent)

Compare this with the capabilities of the Sega MAster System and you'll
see why I hate the monopoly that the NES had.

Tom Hunt developed two different programs. One was a task switcher, letting
you keep several programs in memory and flip between them. The other was a
multi-tasking OS. It was limited, but could keep several programs all
runing at once - I seem to remember playing BASIC games in one session while
a term program downloaded in the background.

You might want to. When something breaks in Win98, it's usually fixable.
When many parts of Win95 go, you're looking at a reinstall.

Actually, the way glass is normally, it is actually in somewhat of a
semi-solid state. If you look at glass in windows that have been around for
several hundred years (or even less than that), you'll find that it is
thicker at the bottom than at the top. This is because it flows slowly over
time.

133. Is this an ATARI NG ???

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-04 00:00:00 UTC
From: sysop.fox-1@stackbbs.xs4all.nl
Message-ID: <915659883@stackbbs.xs4all.nl>
Source record: 56618

After reading this NG for a while now, I'm wondering why it's called comp.sys.atari.8bit...
It seems like 80% of the message's are about emulators. Nothing wrong (well...) with that, but almost every discussion about it, is about the PC-set-up, settings, processor-speed, soundblaster-compatibility, AMD, Cyrix, Pentium, etc...

Then, 10% of the msg's are about "for sale", or "see my url..."...

Left: 10% of REAL Atari 8-Bit information/discussions...

Is there anyone outthere who's really USING an Atari 8-bitter in stead of only owning one, or even haven't got one (anymore) ???

Also, it seems very common to quote almost EVERYTHING when replying to a message. Is it really necessary to quote a 5Kb message, when only writing "I agree", or even "No" as the actual reply ?

Am I the only one with this opinion ? If so, o.k. to me, I'm not the moderator of course, just a reader...

Just couldn't resist to write this message...

> Except the resemblance to the secondary console room and the fact that
> the TARDIS interior can easily be adjusted, you mean...?

Daniel Klugh:
> But they erased all traces of the old TARDIS.What about the roundels?
> You can't very well leave *THOSE* out!

Why not? Most of the store rooms (the empty ones we've seen the walls
of), the boot cupboard (from memory), the pavilion, the wardrobe
(sometimes) and at least one of the labs don't have them. And the
style of the roundels has changed a couple of times, they're only
there because the Doctor seems to favour them. And have a closer look
at the supporting struts by the console, see the round holes...? =-)

> And #2 control room was much smaller.

And the TARDIS interior exists in what amounts to a pocket universe, why
can't the size of the console room be varied? Maybe this is some core
console room, directly connected to the Artron energy flow (hence the
bright blue lights in the central columns), something like a ships
engine room as opposed to the bridge we've normally seen? =-)

> They shouldn't've gotten rid of the white corridors.Why not just use a
> replica of the old #2 set if they meant for that to be the second
> console room.Why mess with it?

And I assume, whilst watching Masque of Mandragora you were sitting
there saying "but where's the white walls, what happened to the console
and why is there a shaving mirror attached to it?".

The Doctor has been travelling in that TARDIS for a *very* long time and
a couple of hundred years with the same decor is bound to get on
anybody's nerves, isn't he allowed to redecorate every now and then?

Jason =-)
> All TARDISes are powered by the Eye (when Omega drains the power from
> Gallifrey the ability to Time Travel is affected)...

Daniel Klugh:
> They never say that in the movie.
> They simply call it the "Eye of Harmony".

Makes no difference, all TARDISes are powered by the Eye, the Eye
therefore has to have *some* sort of presence aboard the TARDIS.
Theories not withstanding, it's been previously established therefore no

problem.

Okay, so it's ropey "science" then. But it's not the first time that
Doctor Who has done that now, *is* it? It doesn't suffer as much from
"swirly thing of the week syndrome" like ST Voyager, amongst others, but
it's had a few moments in the past. Unless, of course, *you* know what
a ray-phase shift is or why the TARDIS needs a fluid link using
mercury... =-)

: No way Willy. Good luck to ya there.

Well, if you want a Black Box and Floppy board, the last I checked Bob does not have them for sale. So, they are not available. Go ahead, call CSS. Anyhow, I was offering an extra Adaptec 4000a and hard disk mech for no extra money. You don't get that from CSS.

My point is that I am selling at the same price CSS sells for when they HAVE them. Don't want it at that price.....try and pruchase them from CSS.....you will onlly pay $390 when they have them in. The guys who have been emailing me try and make it sound like I am way out of line, when in reality, they just don't want to pay the $390 that I paid, and want to get some massive bargain. If you REALLY want one, try and buy one from Bob Puff, and then come and talk to me when he has none in stock. Otherwise, it is of no concern to you that I am selling a rare item for what I purchased it for.

Willy

No actually I doubt that's just it. At least in my case it has more
to do with I already have all that I need except the floppy board.
You should be able to sell the BB's quite easily withought the floppy
board, and I KNOW you can sell the floppy board by itself. Why do you
insist one one big package in light of that?

141. Re: TELNETing to Atari BBS's

I use Mustang Software's QModem Pro for Win95. Besides being a great terminal program it does telnet also. Supports more damn terminal emulations and character mappings than I have ever seen in a program before. Top notch product. I blew the dust off it to do telnetting with it since it's been a coon's age since there has been a BBS scene around my parts.

Seems to me I had one once. It required a expanded memory machine.
Might have been called 'forks' or something.

It required a lot of futzing to set up right if I remember, and I
never really took the time to test it out properly.

Might have been called something else but I know I remember one.

How about a much more indepth answer of "Where is Atari today" :)

The arcade portion of Atari, first off, I believe is still intact.
Atari used to be, as you know, a company consisting of home and arcade
manufacturing. Warner kept the arcade devision, which continues to make
games to the best of my knowledge... so let's follow the other half.

The Atari home computer devision changed hands from Warner to Tremmel,
from Tremmel to JTS, and then lately to Hasbro for yes, five million
dollars.

Let's break down the Atari home market today into categories :

Atari games:
Made under the wing of Hasbro, they have taken the old games
and breathed new life into them. New versions of Frogger and
Centipede come to mind. Some rendisions are awesome, others
don't quite add up to the fun of the original, but then.. that
is a tough call.
It is doubtful that Hasbro will do little more than release
old games with more bells and whistles, but then again.. you
never know...

Atari Game Systems:
The Atari Jaguar, being the most recent 64 bit gaming system,
is still being supported by some third party vendors. A game
called something to the effect of "Battle Sphere" is the
current rage, allowing gamers to make use of the cat box,
making it possible to link several Jags together for a good
multiplayer session. To date there are few games that take
advantage of this great gaming ability, however, Battle Sphere
will be another one besides Doom to do so. The new game
should be coming out soon.

The Atari 2600 is a hit amoungst emulation circles, with
programmers finding it fun to create 4K games to play on
emulators such as Stella and others similar. Last year

a new game for the 2600, "Alfred's Challenge" was released in physical cartridge form at a Atari expo. The game sold out quickly, thus showing that the VCS format is still a hit 20 years after it's initial release!

The Atari 8-bit scene is very strong as a world wide community. Though not supported for well over a decade, the computer system is still supported with third party vendors. CSS continues to sell hardware upgrades, and the legendary black box making hard drives and faster modem speeds possible. Naturally these are not the only items sold, nor is CSS the only vendor. Video61 continues to push the boundaries of new games and programs for the Atari's finest native storage medium, the cartridge. :) And you can still find software in the box with B&C.
And that's just the American scene. Add to that the wonderful advances of users in England, Germany, Poland... it gets amazing. User groups continue to keep the Atari 8-bit more hopping than perhaps even the later Atari computers. Some suggestable large user groups to subscribe to would be Alan Sharkis' group "Ol' Hackers" which have bimonthly newsletter disks, and the Pacesetter in Florida. Those are two of several groups that still enjoy the 8-bit.

The Atari ST, TT, and Falcon are still plugging away. Due to mainly massive support of musicians, artists, and the strange parallel universe of Europe where the Motorola processor seemed more popular than the Intel chip.. the Atarians in this field are still ungrading away, adding faster chips and designing more software and hardware hacks. They fight a uphill battle to keep their machines capible of accomplishing most of the modern computing. To this field, there seems to be a trading off of users who are leaving now that their machine is currently 5-6 years old... but others join for the nostalgia. Still, the Ataris of this group are still quite nice machines.
The Atari Falcons have been upgraded from 68030 processors to 68040 and 68060 processors. How high can they go? Who knows. However, a third party vendor in England in currently releasing the Milan 68040 tower (based off Atari design) right now for 599 pounds.
Along with the ST, TT, Falcon, and now Milan you can keep up with it through "Atari Computing" magazine. There are also groups that lean towards the later Atari computers, such as the Atari Users of North Texas (AUNT).

I had been away from the Atari computer for 10 years, and this is the information I have gleamed from various clubs, magazines, fanzines, discussions, and usernets in the past three months. All and all, there are subcategoies of the above mentioned. Like in the Atari 8-bit realm, those that use regular equipment, mega upgraded equipment (both

prcoessor and memory upgrades), and those who use emulators (both Mac and PC) and those who use the APE connector with the PC.

Point being, in some form or another Atari is still around. Still loved. The advantage of these days, you can go nuts with Atari computing, since the information for a lot of the above systems are vast, the hardware is cheap, and the parts to upgrade them also cheap. You can buy equipment that you wanted to play with for dirt cheap, and the good news is, there are others out there doing the same thing!

Yeh, I use a Macintosh.. gets me around the net, and helps me in my business dealings and net access. It helps me with my hobby... collecting and building a Atari machine. (grin)

Have YOU played Atari today?

Daniel Klugh (dklugh@iwaynet.net) wrote:

: Actually it already does "360k" density,as you call it.
: The reason that the IBM PC gets 360k is because it uses both sides of the
: disk.You can simply turn the disk over in a Atari disk drive.But the 1050 only
: gives you 130k per sides instead of 180k because it uses those little 128-byte
: sectors.You can get it tyo use 256-byte sectors with a simple ROM upgrade to
: the drive's controller board which will give you 360k per disk.
: (but you have to flip the disk over,of course)
: There are countless upgrades out there.

Okay, but what I really need to know is if I can simply swap an mechanism
from the original 1050 drive, and put in a drive from another
manufacturer? I'm asking because I have a whole stack of these
low-density PC drives that I salvaged from cast off PC/XT/AT systems. The
reasoning goes along the lines of, if the current mechanism in the 1050
breaks, then what can I do to fix it, is a PC drive capable of working in
the place of the original 1050 drive? Or will it simply balk at the
weirdness of the drive controller trying to send it messages?

: The US Doubler is a pretty cheap upgrade that's simply one chip replacing the
: ROM and adding 128 bytes of RAM. (to hold the larger 256-byte sector)
: But you lose the ability to get a list of bad sectors after a format.Other
: upgrades add a whole lot more RAM that buffers a whole track at a time which
: works great with the higher SIO rate that these upgrades give you.

I've got one US doubled drive set up as drive 2 (it was causing problems
booting Atari Planetarium as drive #1). Unfortunately no docs came with
it when I bought it at a flea market. :(

: As far as I know,the only Atari-brand drive that uses IBM style drives is the
: XF551.Of course a Percom drive can actually control other drive mechs so you
: might look in to that.

I've seen the Percom in action, and man was it ever fast. DOS booted in
a flash.

: Is there really such a thing as a standard disk drive?
: I think that all the computers (Atari,Commodore,Apple,IBM...) each use their
: own type of drive.

I was under the impression that shugart was the company that basically
invented the floppy drive technology, and that companies making the
drives would all conform to this. I know wishfull thinking right? ;-)

Thanks for the info...

Later...

151. New home for Dr. Who discussion

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-04 00:00:00 UTC

Message-ID: <36907ED9.3AFA@geocities.com>
Source record: 56736
Cross-posted to: comp.sys.acorn.misc,comp.sys.amstrad.8bit,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.sinclair

Hello all... I would answer the question to all eight Doctors and those who have played the Doctor in specials. But before I do, let's do one thing.

I've sincerely enjoy our Doctor Who conversation. I want to continue it. I figured that computer users could sit back and enjoy some good chats amoungst ourselves, for Doctor Who is just as much nostalgia as our beloved computer platforms. Many a night I would program on my computer while listening to a episode of Doctor Who. They were strongly popular at the same time, so it is easy to find Who fans amounst computer groups.

But people are hinting and asking that we move this conversation elsewhere to make way for e-bay adds and sometimes impersonal technobabble on computer components. So what do you say we let the Acorn, Amstrad, Atari and Sinclair have their discussion areas back and find a good Doctor Who user group so we can continue our discussions at length about companions (female..heheh) the Doctor, and so forth.

Let's find a discussion area, and move over there promptly so this conversation won't miss a beat. :)

Your fellow Who fan,

Doctor Clu

PS: Again, for all of you worried about receiving binaries from me... My apologies.. didn't release people did blind downloads at 2400 buad over long distance lines. A friend explained it to me. Sorry, won't upload more binaries.

From: nisse-ma@reze-1.rz.rwth-aachen.de
Message-ID: <76t42e$la8$5@nets3.rz.RWTH-Aachen.DE>
Source record: 56488

Howdy folks

>Yes, I have no doubt the Floppy board would go by itself. The Black Box, I
>am not so sure about.

The BlackBoxes without the FloppyBoard have/need a different EPROM than the
BB's with FB. If I'm not mistaken this is what the FB documentation sais.

CU Mathy van Nisselroy

PS so you can not use either unless you swap the EPROMs or leave them attached
to each other.

154. Page Sequence

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-05 00:00:00 UTC
From: nisse-ma@reze-1.rz.rwth-aachen.de
Message-ID: <76t59j$la8$6@nets3.rz.RWTH-Aachen.DE>
Source record: 56489

Howdy Andre (and c.s.a.8-ers)

I can not find the message you posted here about the Page Sequence you thought I had to use.

First problem is, my Atari will not take 64+1 bytes at once.

Second problem is:

Why set bit 5?

You said use 20-2F, 60-6F, A0-AF and E0-EF

When I calculate the page sequence I need, I come to:

00-0F, 40-4F, 80-8F and C0-CF

(I leave bits 4 and 5 low, you leave 4 low and 5 high, why?)

To all newcomers. MY upgrade (still being tested) (30pin 1MB SIMM till now) uses bits 0, 1, 2, 3, 6 and 7. It gives you separate ANTIC and CPU access and you can switch BASIC and OS RAM and SelfTest while you are in MAIN memory (BASIC, OSRAM and ST are not changed while in Extended memory).

CU Mathy van Nisselroy

PS I normally don't use SParta or TurboBasic, but both seem to run on my upgrade.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the
Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL,
800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend,
several people volunteer their time and energies by maintaining Periodic
Informational Postings for this newsgroup. Please take a moment to refer to
these documents before posting to comp.sys.atari.8bit. The answer to your
question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic
Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

I've just posted an ATR of Realm Of Impossibility to
alt.binaries.comp.atari8bit

I know I've got Zombies too, but on a real 5.25" floppy - I'll transfer it
to ATR if anyone's interested?

Enjoy... I used to love the game (especially the 'impossible triangle'
levels)!

Actually the SNES,Genesis,Ultra 64 and Jaguar all support RGB.
You can buy the "CatBox" from ICD which gives you headphone jacks and RGB &
composite video.

This is truly bizarre.HTML with nameless links in it.Why do you have USEMAPs (i.e. "image maps") with only one href (i.e. hyper-link) to them.Why not just use normal anchors links (the "A" tag)?
And why use pictures of words rather than the words them selves?

And why would you need a 9600bps MODEM for Phoenix?
And certainly Gr.8 will be useless for displaying most pictures.Better to just use a FT-80 type 80-column text mode.But since this is Atari and not IBM,we can use FT-80 mode for text and HIP for pictures.And border-colour (1-colour) lines for horizontal rules.But we'd really be talking about pictures being designed for the Atari to see unless Phoenix is really going to be able to convert GIF to HIP and APAC pictures.Of course GIF only works for 256 (per image) colours so that leaves out ColorView Gr.15 mod
e (16-level RGB;4096 combinations).

I get this when I go to the URL you mentioned later:

Founded: January 1, 1999
Atari 2000 Logo
[USEMAP]
[USEMAP]
[USEMAP]

How come you have the un-ARC programme as a UU-encoded file?
Why do you want the files sent as text?
How are you sending them now if not FTP?

Hmm...okay, I've never used an "ATR" file. I don't own a PC at all (all
Atari's here), so how do I use that file with my 800XL/130XE once I grab
it? Thanks! ;-)

PS I do have a Mega ST4/16mhz, 1040 STe, and a Falcon running Mint(Unix).

Maybe you Dr Who lot should get out a tad more into the sunlight, was
those iron maiden tee-shirts and blab more about the groups respective
name rather than be OFF topic & Xpost to all the groups.

Can't you all join the Dr Who NG's and wibble about it all day in there.

Do I give a monkeys that you find Dr Who fun, Im sure its very nice and
sexual to some but its ISN'T everyones cup of tea.

You would all be up in arms if I started a "your 8bit computer is s**t"
thread. Perhaps not, since it is more ontopic than this rambling thread.

Bleedin messers, get back in your boxes before I get the cattle prod
out!!! :)

Not worth posting Zombies unless there is a collector out there as the
game is not worth playing as nothing attacks you.

Just my thought to save you some time :)

Well yeah, I know all about NES stats vs. SMS stats. Right now I am
trying to make a simple NES game (using an assembler and emulator on PC)
and I am also trying to make the same game on the Atari. Its a top-view
shooter (like Zanac, Raiden, 1943)

I'd make something on SMS but I can't find an assembler.

Daniel Klugh wrote in message <76thsj$bd1$1@news.iwaynet.net>...
>This is truly bizarre.HTML with nameless links in it.Why do you have USEMAPs (i.e. "image maps") with only one href (i.e. hyper-link) to them.Why not just use normal anchors links (the "A" tag)?
>And why use pictures of words rather than the words them selves?
>

I smiled when I seen all the "WHYs" you had in your message! Lots of good questions and the first person to give me any kind of "negative" feedback regarding my page. But to show that I can take critique, here are my replies:

The program I used in designing Atari 2000 was quick and painless, and I had the initial pages (the ones that are online now) set up and uploaded to the web in less than 2 hours' time. Most of that time was spent in layout. As for the USEMAPs that you are referring to, those were used by the web design program in certain parts in order to maintain the layout. Not all browsers can handle tables, either, so I had to decide which of the lesser evils I was going to succumb to for now. That does not mean, however, that it will always be so at Atari 2000. When previewing the pages as they'd appear when someone approached the site, I was very disappointed in how the program set up the links page, if not mildly irritated, since my goal is to have Atari 2000 serve as a "portal" for Atari devotees, and that mapping stuff just ain't gonna do it! So, that is my secondary concern (the primary concern being PHOENIX). So, in response to your "Why?" I will be changing the USEMAP of the links page to "proper" html code in the near future to better serve my goals with Atari 2000.

Before proceeding, though, I want to ask you what you use for a web browser. It's great to have the feedback, but you should have offered something like "the page is incompatible with Lynx browsers, dude!" or something that would tell me how best to correct the situation. I've tested Atari 2000 with IE4.0 and Netscape Communicator 4.5. The music of the main page only works under IE4.0, but I'll adjust the code so that Netscape can play the "theme" music, too. Under those two browsers, it appears fine aside from my concerns with the mapped grafix, which I loathe.

>And why would you need a 9600bps MODEM for Phoenix?

Ah, this was an arbritrary choice of mine. If as PHOENIX comes along, I find that it'll work with less bps-power, than that'll be fine, too. But my concern right now is with the streaming of html code that any given web page may have. I'm sure that a 300 bps modem will work (albeit slowly) in browsing the web, but I'm not sure if *all* ISPs will alllow a 300 baud connection to their service, so I chose 9600bps as the requirement. At the same time, I think I also recommended an APE/SIO2PC cable so that an Atari

can utilize a PC's modem if the user doesn't have access to an 850 interface or the like. the SX212 modem (1200bps) may work, but again, will the ISP allow a 1200 baud connection??? Why bother with an APE/SIO2PC cable to connect your Atari to your PC when you can just use your PC to connect to the internet? Because you could get away with an older PC (XT/286/386) system to connect your Atari to for simply its modem, I guess. I want that route available simply so I can browse the web on my Atari at times. And we can spend the newsgroups' time in debating the back and forth of whether this is a waste or not, I suppose... but I'd rather not. Simply put: you may want to have an 850 device or compatible to use PHOENIX, okay?

>And certainly Gr.8 will be useless for displaying most pictures.Better to just use a FT-80 type 80-column text mode.But since this is Atari and not IBM,we can use FT-80 mode for text and HIP for pictures.And border-colour (1-colour) lines for horizontal rules.But we'd really be talking about pictures being designed for the Atari to see unless Phoenix is really going to be able to convert GIF to HIP and APAC pictures.Of course GIF only works for 256 (per image) colours so that leaves out ColorView Gr.15 mod >e (16-level RGB;4096 combinations).

I'm not sure if you skipped the features list or just could not view it, but PHOENIX is going to be a web browser that supports TEXT-ONLY. The mathematical demands of decompressing graphics is outside the scope of an 8bit that will be busy doing other things. Blame it on the FPU, blame it on the MHz... but don't blame me. So, all this discussion about how am I going to display graphics of any given web page is immaterial. PHOENIX is going to simply throw the html code out for the pix in the long run. No converting to HIP or APAC or whatever (as if I know what HIP and APAC is!). Although it probably could be done, the end result on Gr. 8 mode or Gr. 7.5 would be disappointing to say the least.

Again, it would prove quite useful if I knew what browser/means you used to access the site, so I can evaluate the situation. But I won't be updating the page again until I have the first phase of PHOENIX done, because I don't want to spend my time refining the page when I could be busy writing code on my Atari.

Many thanks goes out to Lance Ringquist for his generous appropriation of certain items to aid in the development of PHOENIX!

I've always read my usenet offline and at my leasure. If you use a good OS
with good news software then you're pretty safe doing so, except for morons
who post binaries where they're not wanted. I run leafnode on linux which
works great, but INN would be a safer choice.

I don't think there's anything extraordinary about offline reading, I did it
for years with UUCP. You don't keep the phone tied up as much and you have
more time to compose.

The game I am trying to find the name to featured 2 stick-men (2 player mode) in a maze type dungeon scenario looking for treasure (anchs etc..) while avoiding zombies (green stickmen) and possibly even snakes. There was a lot of ladder climbing involved as well to get to the treasure. The game was multi screenand almost top-down, some dungeons being more than 10 screens long. I remember the name including "Mine" or "Aztec" or something.

Can anybody remember the name of the game? It isn't Pharaoh's Curse, Loderunner or Montezuma's Revenge.

Thanks,

Daniel Bromley

Sounds to me like 'Realm of Impossibility' by Electronic Arts. Came out in 1984 in the 8" square/flat box style EA did for a while back then. Originally called 'Zombies' it is coded by Mike Edwards. Supports two player Cooperative play. 'Realm of Impossibility' is billed as 'Deluxe Edition of The Classic Game Zombies'.

Who did the HTML product manuals?
The Black Box one has strange artefacts in it.Like the list of features
is actualy a bunch of DD definitions-descriptions with no DT definition-terms.
Why not just make it a UL list?

The ASM listings also uses the weird DT tables.

Colin was asked. But it would have meant signing a contract for a
couple of scenes in one episode, thus making himself unavailable for
other work for over six months so, quite sensibly, he turned the Beeb
down.

S'a shame really, Colin was a good Doctor when the scripts allowed him
to shine and, on the couple of occasions I've met him, a very nice man
in real life. Unlike certain other actors [1] he likes the fans.

> They had a stand in.

It was just Sylv McCoy with a wig on.

How about a Atari 8x16 and 8x8 character set for us Linux/IBM users?
Since VGA uses 9x16 for 8x16 character sets,you have to put the characters
in a certain order since it's the character's position in the set that
controls that 9th column/bit.Which means that you'll also have to create
a unicode-mapping file.I just wish that someone would write a programme
to switch to normal 8-bit characters on-screen.

With a unicode-mapping,programmes like Lynx and others that use box-drawing
characters will work rather than having to switch back to the IBM (CP437)
character set.OF course you'll have to use "setfont atari -u none" to NOT load
the unicode-map and type "@" in Lynx to actually view files written in ATASCII.
(assuming that the unicode-map is in the character-set file)
Of course you'll need to use a termcap/terminfo that's set up for latin-1
(ISO-8859-1)
for Lynx to use the corect box-drawing characters for it's own menus,or else
just put up with weird menus.The termcap file that I use is set up for
the IBM character set so I always do a "setfont" to clear the unicode-map
so that Linux won't try to translate characters from (what it thinks is)
latin-1 to unicode.My terminfo database for "linux" is just a re-compilation of
that termcap file.It's the only one I see on the Internet especially for Linux.

This is a good sign of something tested on Lynx. :-)
Thanks for that... is all fixed now. Amazing the trouble a
little missed
can cause. (Especially when the mistake
is copied to the other two tables..) :-)

Unfortunately I have this work stuff to do :-(so I can't be
searching for more pictures to add for another day or two. :-((
(I am noting every site, of course.) ...but there _will_ be more.
I've already ordered my brother to hunt out my old Dr. Who annual
for scanning purposes.

> What nice pictures you have there at the end.

Yeah. :-) Shame one of them caused all this binary flak. She
looks so good after all. :-)

Aw, damn. Y'know when the tile is named "previews/darktentacle.gif"
and the page looks for "images/bluetentacle.gif", I can look back
and forth at the names many many times and think "Yup, well that
looks right." :-) Thanks. Should be all fixed now. (As with the
bars... oh and the background colour has been set.)

I hope you'll forgive my arrogance, but I haven't worried about the
"its" just yet... I've discovered the new PNG specification and
have been investigating that, (which has taken much time from
Dr. Who.)

What Will doesn't seem to under is CSS "IS" still selling Black Boxes and Floppy Boards on a order by order basis, plus you get a warantee and tech support from Bob all for the same price this guy is charging, so these are products still being sold today. Don't believe me, then stop by the CSS website:

Atari's coin-op division and Telecommunications division were both kept by Warner Communcations in the July 84 sale of Atari. Warner sold off most of the AtariTel assests even though the workers were getting together to try and buy the company themselves. Mitsubishi ended up with the videophone product that Ataritel was developing and began selling it as the LumaPhone in 1988 the reset was sold off to various small companies.

The coin-op division became known as Atari Games Corp and at one point it was renamed Time-Warner Interactive but went back to Atari Games Corp. Warner sold Atari Games Corp to Williams/Midway which now owns them, they still go under the name Atari Games Corp, many original Atari employees from back in the 70's still work there to this day.

The obstacle is called "not enough time". Bob Puff still seems to be interested, but he hasn't found the time yet. And it was supposed to support 48MB according to the BlackBox manual. Please don't ask me where a funny number like that comes from, but it really sais 48MB inthere.

WHat we need more is a DOS that can handle D10: to D15: I'm running out of available drive numbers all the time.

Have you tried the Parity PAL that CSS sells for the BlackBox. It wouldn't recognise my ZIP drive either, till I got this PAL for $15.

CU Mathy van Nisselroy

PS usually, the head count on the BlackBox and the real amount of heads/cilinders/etc. differ. And HDFMT193.COM doesn't work with newer HD's since they can not (and should not) be formatted by the user.

From: Terry Jenkins <terry.jenkins1@virgin.net>
Message-ID: <76u8lkjsk1@nclient3-gui.server.virgin.net>
Source record: 56513

Hi Folks,

I have just downloaded the 8 bit version of Alternate Reality using Xl-It! as an emulator. The batch file that runs for version 0.16 of XL-it! sets up the 4 disks as disk1 side1, disk1 side2, disk2 side1, disk2 side2.

When I use the program everything works fine until it asks me for disk 1 side2. No matter how I try, I cannot get the emulator to recognise this disk.

1. Can you use the 4 drives without having to keep changing the disk images they point to?

2. Am I using the best emulator for Alternate Reality?

I think this game has to be my favourite of all time. I bought it for the Atari XL, the Atari ST, and the Amiga (a very disappointing version), so to get this working properly would be terrific.

Anyone got any ideas?

Thanks

Terry Jenkins

198. FS: Dead 1050 Disk Drives and NEW Stepper Motor (USA)

Source record: 56514

For Sale (USA): Stepper Motor for 1050 Disk Drive

I just dug out a NEW stepper motor for a 1050 disk drive from our parts department. If anyone needs one to repair a dead 1050 disk drive, you can have it for $5.00 (to cover our cost of Priority Mail shipping and handling -- shipping within the continental 48-state area only).

Also have several 'dead' 1050 disk drive units which need repair. It is no longer feasible for us to repair them (my technicians time would cost more than these drives are currently worth in today's market), but if anyone would like to tackle the repair, you can have the drives for $10 each without power supply (Priority Mail Shipping INCLUDED) or $17 each INCLUDING Power Supply (Priority Mail Shipping INCLUDED).

Please respond in Email to: s.winick@worldnet.att.net

Played the Valeyard in "Trial of a Time Lord". There is some confusion
as to who (or even what) the Valeyard actually is but I tend to include
him because the Master refers to him as "the Doctor".

> And Who again? David Banks?

Bank is best known as the Cyberleader ("excellent") from Earthshock
onwards but, during the stage production of Doctor Who, Jon Pertwee was
taken ill and for one night only David stepped into the limelight.
Sadly, no footage but I'm told by indirect sources that he was very
good. His incarnation of the Doctor wore a Greenpeace t-shirt and
sports jacket, apparently.

203. Alpha version of Dir2Atr with SpartaDOS support

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-06 00:00:00 UTC
From: stack@xs4all.nl
Message-ID: <3692b7d2.2849607@news.xs4all.nl>
Source record: 56519

Hi Atarians,

Iï¿½ve just updated my Atari XL/XE homepage.
You can find a new version of DIR2ATR here,
This alpha version 5.00 supports SpartaDOS disks as well now.
Well.... As far as I can tell of course. Maybe you can give it a try
and reports the bugs to me.

With DIR2ATR you can turn Pc directories containing Atari 8 bit files
into .ATR disk images.
With version 5.00 you can turn them into SpartaDos .ATR disk
images too. It also supports subdirectories.

Remember this is just an alpha version. Just wanted to know
what you think of it, and if it is stable enough.

Best wishes,

Bo Schreurs

Well I've tried giving them something sillier to respond to and, at the same time, trimming crosspostings to just comp.sys.sinclair where the Dr Who stuff posters seem to generally hang out.

However, despite several requests to fuck off to Dr Who Heaven (expressed more moderately than that) some of the silly buggers are carrying it on, even to cross-posting a binary.

There seem to be two choices if they continue:

(a) report them to their ISPs

(b) go round mob-handed and give each a good kicking.

What do you reckon?

speaking of alternatives, i have a macintosh on my desk, (actually 3 of
them...one for linux one for programming and one for everything else) i
currently dont have an 8bit on my desk because i playwith it too much and
have a project i need to get done (which i am supposed to be doing right
now;') and i will have a macintosh (and my 8bit when the project is done)
until it is as obsolete as a vic-20.... but i dont think this will be anytime
soon seeing that where i work we have 7 macs and one 286 (it has old company
data on it. this summer i am to be moving its data to a mac so we can get rid
of it...) but then you never know maybe some idle hack who grew up on an 8bit
will decide they want the atari back and design a new version of the 6502
that runs in the ghz... look at the 65CE02 what was the point in it? (besides
being a cool hack?)

sloopy.

>First problem is, my Atari will not take 64+1 bytes at once.

I thought there was a way... (long time ago). Ok. try this:

1) Start SUBMON (or some other memory monitor) under MYDOS.
2) patch MYDOS at adress $0BBA with the 64 bytes of your pseq.
3) patch MYDOS at adress $0C3A with '$7F' = 127. (pagecounter *2 -1)
4) go back to MYDOS and 'WRITE DOS FILES'

I hope i dont forget anything.

> Second problem is: Why set bit 5?

The pseq i told you was calculated by MEMDRV.COM.
The difference is that my example doesnt use the separate ANTIC access. MYDOS dont cares about this bit. You can use both, yours and my example.

You can find MEMDRV.COM and a link to SUBMON.COM on my HP.

i want the bb but the cost is too large for something that goes with such an
old machine (i dont mean Mr. Moeller is too pricey, i understand his point, i
mean bob's price is a little high...) but until the price come down for them
i will just wish i had one....

sloopy.

p.s. i love the open barter system.

Fellow whovians,

My previous sincere request for a new location for this thread was blissfully ignored, which has even me, and STRONG Who fan, feeling somewhat annoyed. I now understand how the other non-whovians feel.

I love the conversation, but if I don't start hearing some suggestions for a Dr. Who usernet area that we can take this too PRETTY PRONTO I'll be helping these others users strangle your scarf wrapped necks! Am I understood?

You've ALMOST driven a die hard whovian against you. Now ENOUGH is ENOUGH...

Only a few - 1: Get a newer version of XL-IT! 2: Get AtariWin
also.. AR: City (which i assume you are playing) only uses 2 floppy
drives... Also, there is an AR mailing list and FAQ (info i'll post later
- don't have it offhand)
also, if worse comes to worst, email me, and i'll send you the latest xl-
it! (atariwin can be found at www.davesclassics.com)
also, once you get it to play, i think if you leave disk 2 (both sides)
in both drives, that 'should' minimize disk swapping (except for saving
the game) in AR: Dungeon, you can set all 4 drives to disks 2 and 3, and
not swap at all (except for save/loads and rebooting)

Hey, to the moderator of the newsgroup: Is it ok to post the AR:FAQ here?
(thought i'd better ask first)

An amorphous solid, or a supercooled liquid -- depending on how you look
at it. In any event, it's not crystalline, and flows, just like the man
says. We used to tell the story about the lab assistant in the physical
sciences department of a high school who received a bundle of
small-gauge glass tubing one day. He just leaned the package in the
corner of the stock room and forgot about it. A year or so later, when
they needed the stuff, he opened the package and found that all that
nice, straight tubing had sagged and was now bent.

In the sacred domain of comp.sys.sinclair didst Paul Irvine <mclane@dellos.demon.co.uk>
eloquently scribe:
: Maybe you Dr Who lot should get out a tad more into the sunlight, was
: those iron maiden tee-shirts and blab more about the groups respective
: name rather than be OFF topic & Xpost to all the groups.

A little OTness in comp.sys.sinclair is ok. We tend to be a bunch of sillies
anyway. I don't have the time nor the inclination to read any more groups
though.

Ever heard of the KillFile?

: Do I give a monkeys that you find Dr Who fun, Im sure its very nice and
: sexual to some but its ISN'T everyones cup of tea.

then killfile the subject, and you'll never see it again.
It seems to me that quite a few people are enjoying this thread.

If you REALLY insist, tell me what group YOU are in, and I'll remove it from
the followup line next time I post to it.

: You would all be up in arms if I started a "your 8bit computer is s**t"
: thread. Perhaps not, since it is more ontopic than this rambling thread.

No, we wouldn't. We like having the odd argument about that type of thing.
Hell, there's a "The C64 is crap" thread here that's been going on and off
for several YEARS.

: Bleedin messers, get back in your boxes before I get the cattle prod
: out!!! :)

OOOOO. Cattle prod.... Yes please....

:)

> That's strange.How would that lock up your computer?

My comm program has a wee bug in it. If I run out of disk space while
downloading, it freezes. Actually, I wasn't even aware of the bug
until "The Dark Day of the 50MB Spam-Bomb".

And, as I said, I am much more careful, now. I dump the xover list
first, give it the once-over, delete the undesireables, then download
from the modified list. It really doesn't take all that much time.

This is correct. I keep forgetting the XLs had pretty broken video output (the stock 1200XL is particularly heinous). The 65XE does have all the signals, I used one for a while. Incidentally, the 600XL motherboard was designed to have a monitor jack; it is possible but tedious to add it in right on the circuit board. See Ben Poehland's Super Video upgrade.

Can anyone help?....I ahve just retrieved my wonderful 130xe and
a box of disks full of games and I have all the connectors except
the one between the conputer and the TV!!!!
Can anyone advise / help I would be most grateful

Many thanks!

Richard Owers

Sadly one of the big culprits is a CBM bloke who is bonkers re Dr Who.

Come on folks, I can't imagine everyone from all these groups really
wants to read about Dr Pooh, its now 5 groups worth of fed up people who
read as many posts about this nonsense as their chosen groups topic.

Now clear off to a Dr Who ng and take some Viagra Lite...

Guess the punchline...

Tis bugging me, I thought I had set most of my old routines to be reset proof via software on the 800 I had. Seem to remember settling 244 hex to 0 and point locations A & B in high low order to the code run address.

Not got my 800 anymore...

Cheers Mike..

237. New ATARI-Filelister

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-06 00:00:00 UTC
From: HCRBurk@t-online.de
Message-ID: <770bua$5ca$1@news03.btx.dtag.de>
Source record: 56653

Hi atarians!

A new release of the Filelister (1.0 0004 - WIN 95/98/NT) is complete.
Features:
- Freeware
- Management of XFD/ATR files
- Lists directory structure (DOS/MyDOS/SpartaDOS)
- Import/Export (ASCII, Binary) for DOS/MYDOS/SpartaDOS
- Management of tools for work with other programmes.
.. and much more.

For the ATLIST.ZIP file look at:
http://home.t-online.de/home/hcrburk/afldown.html
or http://members.aol.com/MacFalkner

I soon make a DOC available.
I will still integrate the SIO2PC functionality into future.

Please give a feedback if you find bugs or if you have other suggestions.

thanks,
bye, Burkhard

No, he was FIRED, then they realised they needed him back for the
regeneration so asked him to come back and do it. Quite rightly he told
them where they could stick their regeneration.

GtB

P.S. I have 1 Spectrum 48K, 1 Spectrum +3, a QL and 70-odd Dr Who
videos, anyone else got claims to the sad-retro gamer, dodgy sci-fi
series crown of geekdom?

I do know that the Atari 400/800 take a different power supply than the XL's
/ XE's....
It is a 9vac output with 3.4amps
That is all I can offer....
Hope it helps

Bill

You need a .DCM file of it then. Then you can use Bob Puff's Disk Communicator to make it a disk again. Ask him to convert it to a .DCM file.

>Ever heard of the KillFile?

Screw you. That is the most arrogant attitude I have heard in some
time in here. If you want to discuss Doc Who then you had better read
another newsgroup about him. It is preposterous that you suggest
everyone in here start dabbling in filters and kill files and what not
to try and filter out content that is clearly off topic, because you
don't feel like subscribing to a group more on that subject.

Now, I don't mind a bit of off topicness and haven't really even made
a stink about it even though it was getting to the point of annoying
me. I am not easily annoyed by off topic discussion but this whole
Who thing has gone too far even for me. This message of yours was the
clincher for me to say something. Now I'm pissed. Thanks for helping
me make up my mind.

I obviously am not the only one getting ticked off either. You think
it's okay because there are some who are enjoying it. At the same
time you know some are annoyed by it. If you all would talk about who
in an appropriate group, and talk about the 8 bit computer stuff here,
then NO ONE GETS PISSED and people can ENJOY WHATEVER SUBJECT PLEASES
THEM in the appropriate place. Is that not obviously a better
solution than what you propose? Oh I forgot, that would require YOU
to actually subscribe to a Dr. Who group. How dare anyone not care
about inconveniencing you so greatly. Yeah right. Piss off.

250. Re: RED screen on XEGS

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-06 00:00:00 UTC
From: Jeff Jewell <jjewell@ix.netcom.com>
Message-ID: <3693DF1C.335364C2@ix.netcom.com>
Source record: 56666

If you have one available, try a different power supply. I have a 320XE that made me think the memory upgrade was screwy because sometimes it would run, sometimes not. Occasionally when it didn't run, I'd get a completely red screen. It threw me for awhile, because the power light on the computer came on, but something wasn't right.

New power supply, it's been working ever since.

Good luck,
Jeff

You think it's bad here, you should see the ST newsgroup. Milans, Falcons, MagiCPC, almost nothing having to do with STs. And God forbid you point this out to them...

> Then, 10% of the msg's are about "for sale", or "see my url..."...

I personally think these types of messages are at home here, assuming the sale/web site is largely 8-bit stuff.

> only owning one, or even haven't got one (anymore) ???

Depends on what you mean by "using." I own 11 Atari 8-bits, and four of them (320XE, 256k 800XL, 1200XL, and my original 800) are "live," meaning I can go turn one on and it's hooked up and ready to boot (I just have to swap a monitor cable: only got 2 proper monitors for the lot). I've got MIOs on two of them, the 320 and the 1200 are hooked to 4 1050's through an MPP MicroNet, the 800XL is my APE machine, and there's two 810's and an 850 hooked to the 800.

To be perfectly honest, I mostly use the Ataris to play games. I've got stuff like terminal programs and word processors and such, but my PC is typically on every day and that's what I "use" most often for those tasks. I get a kick out of being _able_ to use the 8-bits for "real work" as well as games, but day-to-day it doesn't happen much.

Jeff

> out!!! :)

Now now, this is why the good lord invented killfiles.

Besides, things like Dr. Who and Blake's 7 etc. are just the
kind of thing most of us 8-bitters grew up with... so why
shouldn't the bounds of on-topicness be stretched a little
when it's something so common to us all.

(Hell, it's about the only thing that us 8-bitters can discuss
without getting into a fight.) :-)

Nathan.

PS: Who was the cute blonde on Blake's 7 that they found after
the Liberator was lost?

Cvendel (cvendel@aol.com) wrote:
: What Will doesn't seem to under is CSS "IS" still selling Black Boxes and
: Floppy Boards on a order by order basis, plus you get a warantee and tech
: support from Bob all for the same price this guy is charging, so these are
: products still being sold today. Don't believe me, then stop by the CSS
: website:

: http://www.nleaudio.com/css/index.htm

: Curt

What Curt does not seem to understand is that despite the fact that CSS has never STOPPED selling Black Boxes and Floppy boards, they don't ALWAYS have stock. Ever wonder why CSS tells you to call first before ordering a Floppy Board? Warranty? If it breaks, Bob will fix it for a price....just like if mine breaks. Tech support? What tech support is needed? And, yes, I was/am selling my BB/FB for the same price.....but mine comes with an Adaptec and HD mech. Curt, you are fully welcome to spend your Money at CSS and then try and get source your own HD and controller. No one is stopping you.

However, if one of you people find you really want a Floppy Board, and find CSS is once again out of stock, (pretty common) come and talk to me.

Simple. Curt is just pissed because I wont agree that an offer of $200 for a BB/FB/CASE/HD is reasonable.

Oooh, ooh ooh!!!! Please report me to my ISP. Pretty please!

I'd just *love* to see the shock and dismay they'll display when
they find out one of their subscribers has _posted_ _off_ _topic_!

Maybe they'll shut down my account. Maybe they'll report my
actions to the rest of the ISP's in Christchurch! Maybe it'll
even appear on my criminal record! I'll be marked for life!

Employer: I'm sorry son, but we couldn't possibly employ you...
Me: Why not sir?
Employer: I'm sure you can appreciate the social stigma that
is associated with people who post off topic.
Especially when it is done with such blatant disregard
for the wasted internet bandwidth.
Me: Sorry, I sometimes forget how easy it is to post huge
amounts of wasteful data through a simple terminal
session on a 14.4k modem... Oh the shame!

</remorse>

> (b) go round mob-handed and give each a good kicking.

When the emulators first hit the scene, that bugged me a lot. But I've long since gotten over it.

>Then, 10% of the msg's are about "for sale", or "see my url..."...

As long as they're 8-bit Atari related, this seems like a good place for those messages...

>Left: 10% of REAL Atari 8-Bit information/discussions...

Look at it this way: Do we want this newsgroup to see 10% of the traffic as it does? I don't.

If they aren't using real 8-bit Atari's now, at least most people posting here did at some point.

You've got to figure the number of people using real Atari's will continue to slowly decline forever, but as long as they're alive and keeping the Atari 8-bit alive in some form, I'm happy to see the newsgroup used by emulator-users. As long as those of us with the genuine items are still welcome!

The emulators will never be perfect, so.. some emulator users may be tempted to get (back) into using the real thing.

>Is there anyone outthere who's really USING an Atari 8-bitter in stead of >only owning one, or even haven't got one (anymore) ???

I've got 3, one "power" setup used mostly lately for checking e-mail from home (130XE, XF551, XEP80, P:R:Conn, 2400bps modem, SDX 4.22, Ice-T 2.71), one setup for games (I just bought a bunch of L.K.Avalon games via ZTM Software Manufacturers), and a spare. They don't get used all that much, but I still buy things for them from time to time. And I always check out whatever's been placed on the latest DOM from my local user group, SPACE.

The emulators just don't interest me much.

-Michael

And nowadays I have learned to deal with the morons. Since I run off a
floppy I have to be particularly careful. I have a two-step retrieval
system -- catch the xover list first -- then download the good stuff.
And what gets eliminated first is those postings larger than 10kB,
except for those that are exceptionally interesting.

> I don't think there's anything extraordinary about offline reading, I

Not only that, but if you keep all the goodies on a floppy, you can
read the news off any computer, connected or not. I read off borrowed
computers all the time.

Um, now let's see:

comp.sys.amstrad.8bit
Well, I think it's safe to assume that's an 8-bit group.

comp.sys.atari.8bit
Same here...

comp.sys.cbm
99% of discussion here is on the c64. The rest is c128, vic20,
plus4, pet etc... they're all 8 bitters...

comp.sys.sinclair
99% of discussion here is on the Spectrum family. The rest is
QL, Sam Coupe, ZX81... still all 8bitters (except the QL, right?
but that's only posted on rarely... still largely fans of other
sinclair machines that post on that one.)

And the acorn group keeps disappearing... Though it also keeps
reappearing... don't know why...

So where are you talking about?

The RCA jack on the back of the Atari pumps out straight RF and expects a 75-ohm connection. i.e. Take a normal cable TV wire and replace one of the F-connectors with a RCA plug. That's all you need assuming your TV has a normal cable connection.

Suggestions:

1. If you've got a modem for the 8-bit, upload the file to a friendly BBS
using the ST and then download it on the 8-bit.

2. Use a null-modem between the two computers.

With those specifications, you should be able to make do with a power pack
from a 1050 drive (9vac 4amp) or, if you can find one, a 1027 printer PS
(8.5vac 5amp). The 1027 supplies are the best part (and probably the only,
still-working part) of the whole 1027 package--the case comes apart and
the transformer is protected with a pigtail fuse.

Well Bo.... I ran into a snag. While trying to scan pages into my OCR package, the binding of the books makes it hard to scan the text near that area. Looks like I would have to either seperate all the pages out of thir binding or else type it all in by hand. Don't feel like either right now. If you really need it though I would consider making the effort.

270. Percom Drive for the Atari

I have recently aquired a PerCom Drive for the Atari 8-Bits.
I am having trouble with it.
When the computer is turned on, it will not recognize the drive...
There are about 6 rows of pins in the back (For Jumpers)
Currently there are jumpers on the 2nd set and 3rd set
.XX...
.XX...

Something like that.
Can anyone offer any help or tell me the jumper settings for the drive #.
I assume it is not set to drive 1, but don't know...

Thanks,
Bill

In my opinion, XL-it was the best emulator, it was released free and uncrippled. I know there was a version .18 and I think there was a .19. Markus Gietzen seemed to disappear after .19 I think he got a job, and stopped the work on the emulator. I think he was a college kid when he did XL-it. A lot of emualtors are done by college kids for fun.

There are AR disk images out there that do not work. What someone did is make an image of a non-functioning AR Disk, one that got caught by the intricate AR copy-protection from 15 years ago, or just a fouled up pirate version. There is aworking set of cracked AR images. Last year or in 1997 an AR author actually showed up asking for the cracked image, in CSA.8bit. This was hilarious because I remember Darek Mihocka (author of Xformer) denounced the guy as a "sleazy pirate" but, hey Darek, he WROTE the program.

People got after Yogi for having his incredible online archive of mostly cracked 8bit games and what have you, but the fact is that Yogi and others provide a service as file-archivists, and they ensure the survival of software.

>Guess that means 512K would/should be
>possible.

Hi Mathy-
Did you by any chance talk to Brad? I bought
a couple of these same carts (I think they were the same) several years ago,
and my recollection is that the 512K is 512 Kbits
(64KB) not 512 KB. Mine have 2ea. 28 Pin
sockets. I would also presume this is Kbits,
since Eproms are normally referenced by the
number of bits, e.g. 27128 = 16KB. I read/heard the the Flight Simulator is
the
largest that Atari actually made and was 64KB.
I also believe that Sparta Dos X is 64KB,
and maybe the Gem-like O.S. whose name
escapes me at the moment.

>and R1: through D9: and R9:.
>

Hi Mathy-
Did it have any documentation? I am curious
about the RS232. What does it do with RS232?
Converting the ATR or XFD is fairly easy,
probably the most troublesome part is writing
out the 3 SD sectors from a DD image. The
only way that I could devise to read the directory is to read the file right up
to the
directory sectors. Not bad on a HD, but that
would be a bear on a floppy.

Bill,
I see in another post that it is available on-line in HTML format.
However, Having this in a file on a local drive would have its
advantages. Please scan it in as a single file. Manuals I've done were
saved in a couple of formats. ATASCII, ASCII and Winword formats.

I'm finally learning 6502 Assember after all these years on real Atari's, and
I absolutely agree -- there's nothing like the real thing. However, in many
situations you will catch me in an emulator...

like at work (I'm a Win32 developer, ok I'm out of the closet) many times
I'll fire up Atari800Win in the dinky windowed mode and code a few lines of
6502 while no ones lookin' ;). Of course I do have a spare 800XL sitting
right next to me at work, currently connected (via APE -- now there is one
awesome emulator worth talking about) to the company's nation-wide LAN.

I use 'em all the time, but mainly for fun... programming, games, showing
off. The network administrator was absolutely stunned when I had him start
his stop watch, flipped on my 800XL, and check out a directory of an NT
server on the LAN in under 5 seconds (Now try that on a P-II 450). I don't
think the emulators hinder the Atari hardware, nor this newsgroup, but rather
enhance it.

AMEN !!!!

I think that whatever we decide to talk about, wether it be Emulators,
Games, or even actually programming on a 8-bit, it is all considered good.
I'm proud to own an Atari ! I have a 800, 800XL, 130XE, and a 600XL on the
way...
I like a place where if I have a question or comment, I can make it with out
being critized!!
Wether some one is looking for a certain piece of Atari hardware or wants to
wants to sell one, I think it is welcome here.
But this is all just MY opinion.....
I hope Atari will live forever........
BTW, M.U.L.E. Rocks !!!

> ï¿½
Mathy, I have in the past added several things to the cartridge port,
6551, 6520, various 74lsXXx latches.

Never really figured out what the best way of doing it would be, went so
far as to buy ~256k CMOS RAM, but latching the memory addresses is
really simple. For instance, if you want to just tie the cart select
line to the !CS line of a 6520, you just tie the other lines of the
exactly as you would the existing 6520 in the system. Only exception is
the IRQ line which isn't in the cart port.

IIRC, you can tie one of the 6520's !CS or CS lines to the 8th bit of
the address buss. That makes the 6520 appear in either the upper or
lower half of the $D5XX page<?>. If you really wanted too, you could
decode the bottom 1/2 of the $D500 page to add 32 6520s which would give
you more then enough latches to do 512 extended address lines.

What I was thinking was along the lines of having the RAM appear from
$D580 to $DFFF or 128 bytes with the 6520 toggling 16 bits of address
for potiential of an 8 meg persistant RAM disk. Then real life got in

the way<grin>.

Maybe all of this is off-topic, including this reply. Maybe I don't, or
shouldn't (when did that stop me?) like the fact that it's off topic.
But if it brings out good writing, I'd be inclined to let it pass.

Now, that's where you begin to sound like some maturity's missing. I
comment here. If I'm correct, I like to see agreement, although I can
live without it. If I'm incorrect, and somebody points it out, hey,
I've learned something.

Emulators are on-topic. Getting into an NT network with an 800xl
connected via A.P.E. is also on-topic. F/S, F/T, WTB, F/A messages are
on-topic. Dr. Who? Well, some guys are trying to find a connection,
and I guess I can tolerate that thread when I'm in a good mood.

Hello Paul,

Actually I lied, it was a commodore 64 featuring 18 com. systems from season four but never mind. Anywhere I wasn't the one who started this thread.

It is used with a null modem cable. It will read a floppy and send it
to another computer which via a terminal program can save it to
an XFD. It can do the reverse and receive ATR or XFD images.
It only does image tranfers and not file transfers. It can only handle
standard single, enhanced, or double density sizes. (not sure how
it will handle smaller images). Mega-images weren't commonly
used at the time it was created.
>Converting the ATR or XFD is fairly easy,

>would be a bear on a floppy.
>Larry

The bad news is: It doesn't support XModem CRC but only XModem
with checksums. (Actually it might receive Ok. but not send since it
incorrectly answers the receivers request for CRC.) Receiving
double density ATRs may not work - don't think I took 128 bytes sectors
for the first 3 into account. It doesn't actually look at ATR headers but
generally uses filesizes (or asks for the type). The reason being is I
couldn't
find the specs back then. Someday I have to dig out the source and
fix some things and update it.

A file extract utility would have the problems you mentioned above but
would be feasable.

Of the groups in which the posting to which dgs followed up appeared, only
one isn't specifically for a certain brand of 8-bit machine. And only one
keeps disappearing and reappearing - I wonder, could it be the same one? ;-)

Jeffery Thomas wrote in message ...
>Fascinating, but is that the limit of the bank switching capability, or
>could it go further? Could more memory be handled?
>

The real question is how to properly utilize memory in this manner since it can only be accessed in blocks at a time rather than one contiguous block. Too much bank switching can end up slowing down the 6502, the same as too many DLI programs. Have certain routines per 16K memory block? And have a table-driven kernel that evaluates whether any given command (ie BASIC command/function) is within which block according to its indices, then call it up... this would provide an excellent possibility for a programming language (similar was BASIC XE's cart-based product, I'm sure). The same method will be useful in developing PHOENIX, so that I can use "active" RAM for better purposes while leaving much of the interpreter in a bank-switching kernel.

Is it practical for anything other than a RAMdisk to have a 512K cart? if the programmer cannot access the banks easily? Can the BASIC XE access more than a 128K machine's banks of RAM? Yes, the Atari can probably handle the 1088K XL upgrade, but... same question. And I was reading in either De Re Atari or the Technical Ref Manual that the way the memory is set up, a person could install numerous additional ANTIC chips, PIA chips, etc into the system and have them all accessible because the internal one only uses 4 bits of the several memory addresses assigned for accessing them. Now, what might a person do with even one additional ANTIC chip installed into the system? Are we talking about suddenly being able to run multiple monitor displays like Win98? Or how about multiple POKEY chips? A truer sound system? Midi capability? Why wasn't this avenue ever explored? Even now, why hasn't anyone considered the possibilities???

```
< BB-EPROM / FB-EPROM >
Mathy,

My most recent black-box has the ROM Rev. 2.16 and is able to support the
FloppyBoard, if one is connected of-course...

It's the so called "Task-Master" ROM, and has also the FB-formatter build
in, which can also be used to format serial diskdrives, in either My-Dos-
or Sparta-Dos format...

I don't have a FloppyBoard connected, but the Black-Box runs great on my
"non-BBS" Atari 130XE. On the BBS is a Black-Box with an older ROM
installed (1.41?) without task-master, and without FloppyBoard support...

Both BB's have the Hardware-Flow-Control and "D9:" support of-course (not
supported in older ROM revisions).

Sysop Fox-1 (fox- AT aq DOT nl)

Gateway: THUNDERDOME, Atari 8-bit BBS. Running on ATARI 130XE. (Pro-node 471)

Atari Software 1984

This is a 'MUST' of any Atari collector
This book/catalog covers the Atari 2600/5200/400/800
Also some Atari 600/1200XL/1450XLD
Cartridge, disk and cassette games
It is 429 Pages and is an Awesome Book
Each Game is reviewed plus this info for each game

Company that made the game
Language it's programed in
Hardware required to play the game
Game catagory: Educational, Entertainment, etc
Sugguested retail price
Availabilty
Format: Disk, tape, or cartridge
Overall Rating
Game concept
Creativity
Game Depth
Ease of USe
Skill Involved
Challenge
Graphics
Error Handling
Documentation
Holds Interest
Value for your money

Also there are B/W of some of the games
This book is just Amazing and in Very Good condition

> The floppy board was meant to be the >incentive to buy the whole thing.
>> Last time I checked, they were not in. I am >>sure he has some runs made periodically.

For folks with a BB and *no* Floppy Board,
a ZIP drive has proved to be a very good
alternative for me. An internal SCSI Zip
can be found for ~$99 w/o the PC card. An
external can be used, but requires an
adapter.

On my hardware (w/FB):
1) In native Atari mode, good 1.44's are about
99% reliable. Not as reliable as a 1.44 on a PC, and not as reliable as a 720K A8 mode.

2) Using 1.44's to move files from a PC to the
A8 has proved to be quite unreliable. 10-20%
of the disks that I try to move produce errors,
stopping the process. Again 720's work very
well. I mention the file moving, since that is one of main reasons I bought a FB. I now
use SIO2PC/APE.

3) A FB with 1.44's in A8 mode is as fast as it
gets with an Atari floppy, definitely faster than
Ultra Speed using a converted XF551 w/720K,
but not as fast as a ZIP. The ZIP
is just slightly slower than a hard drive.

I'm not minimizing the FB, but this does seem
to be a very viable alternative.

320. XEP80 & JAM!!

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-08 00:00:00 UTC
From: lwhite6497@aol.com
Message-ID: <19990108000959.05282.00009352@ng11.aol.com>
Source record: 56440

It's been a while since this came up.
Although the XEP80 leaves a lot to
be desired for 80 column display,
until something better is published,
it's what some of us are stuck with.
I had no luck getting my XEP80 to
work with the JAM!! Has anyone else
tried and had any better luck? It
probably would not take to much
tweaking of the XEP output to get it
to work (speculation..) Likewise,
did anyone else run into a problem
with the Super Video upgrade in a
130XE and the JAM!! as I did. I had
to rip out the upgrade to get it to work.

Yes, sure!!!! You don't know one of the best games called M.U.L.E.???
Shame on you! So,please download and play it!!!!!!!

You get it here (only as ATR):
http://homepages.ihug.co.nz/~aaronat/atari.html

Enjoy it!

I've been playing AR using Atari800Win v2.4 with no problems.

I can't remember where I got the ATRs from though - I can post them to
alt.binaries.comp.atari8bit if anyone wants them?

I had problems when the I connected too many drives to one wire in my switched power supply and when I had a bad contact between crimp on connector and BlackBox. That's all the problems I can remember I had with the FloppyBoard.

>2) Using 1.44's to move files from a PC to the

I have no problems what so ever. Only time I had problems was when I tried to read 720kB 3.5" disks formatted (in PC format) with the FloppyBoard and BBXFER. The XT just wouldn't read them. Heck, it formatted these disks and told me it had lots of bad errors, I then toke them over to the FloppyBoard and they formatted OK. Some PC/drive combinations seem to be VERY picky.

>3) A FB with 1.44's in A8 mode is as fast as it
>gets with an Atari floppy, definitely faster than

The FB is fast all right. The ZIP is faster. Don't know if it is slower then the harddisk I have. Sometimes it takes longer for the ZIP drive to access data because if you don't access it for a couple of minutes, the motor will stop running. But most software (maybe even all) have enough patience. It would be nice if you could store the partition list on a ZIP disk though.

If anybody ever wants to rewrite BBXFER please include the following:

- ZIP drive support so we can read ZIP disks that are in PC format.
- copy PC disk to PC disk
- maybe even a simple diskeditor (to change filenames/unerase files/restore directories/FATs)

>I'm not minimizing the FB, but this does seem
>to be a very viable alternative.

I like my ZIP, but I couldn't live without my FloppyBoard. Heck, if I save a message from Email, csa8 or download a file from the net on one of the computers here at the university, I take the disks home, start up BBXFER17 and copy them to my trusty XE.

>have stock.

Didn't Bob drop the price of a BlackBox to $149.something a couple of years
ago. And nowadays, the enhancer seems to be standard equiptment.

>Warranty? If it breaks, Bob will fix it for a price....just
>like if mine breaks. Tech support? What tech support is needed?

Sorry. Bob fixed/replaced my BB&FB twice. Can't remember what he wanted the
first time, second time he just asked if I could cover the postage (which I
still have to do. I'm a student plus sending money to the USA is expensive if
you send small amounts (expensive compared to the amount you're sending). I'll
send him the money as soon as I get it. He NEVER asked for it. He didn't get
angry with me when I told him the fault was not in the BB-FB but in the cable I
had made (it had developed a bad connection over time).

What tech support?

I asked him about the possibility to add extra PBI devices (more then one
device one the bus, one of them being a BB). He told me he would have to look
that up. I asked him about MyDOS. He tried to help.

>Simple. Curt is just pissed because I wont agree that an offer of $200 for
>a BB/FB/CASE/HD is reasonable.

$200 is a good price for it. HD's are cheap nowadays and BB cases were never
worth the money Bob had to ask (in my opinion).

I'm not trying to piss anybody off. Not even you Willy :-))

Hey, it's good to know that you English folks drop the second number of the area code. Dutch Telecom always tells us to drop the first character of the area code when calling international. Ofcourse, if you call to the USA this isn't true either (don't drop a thing).

Why is it "Telecom" isn't spelled "Teledumb"?

Either they don't know what you want or they tell you the wrong thing. Halve a year ago, the newspaper overhere publised an article inwhich the told us Dutch Telecom had told them that the European way to put letters on phone was different from the American system. "they start at the 1 button, we can't do that, so we now have to redesign the system" Only thing they REALLY did was add the Q (inbetween PRS) and the Z (same button as WXY).

It's ONE chip. You either solder it on top of the LS640 (close to the SCSI port) or (if you have a floppyboard and therefore not enough room) underneath the BB. It's 9 wires if I remember correctly. I had Bob do it while my BB was at CSS. Give Bob a call, he'll probably know if you need one.

Same here. But I want the XEGS to have an Missile Command. Even if I never
use it. Hmmm, maybe we could something else inthere. Is strip poker 8kB?!?
:-))

>The dis-advantage I have now, is that I can't use the internal BASIC
>anymore. Also Missle-Command is of course not available in the installed
>800XL-Rom...

WHat's an XEGS without internal BASIC and Missile Command.

Looked at the motherboard of the XEGS yesterday. Looks like I'll have to
desolder two pins of the Freddy for my upgrade (or find a way to make it work
without the co25953 - gate array. I like co25953's).

If there ever was a device the Tramiels f***ed up it's the XEP80. The NS405 that is inside can do colors. And it should have had twice the amount of memory it has now. It has a 16 bit bus, with the "extra" memory, you could have given each character an other atribute (upside down, inverse, etc.) and more stuff like that. Heck, I bet if they would have done the job they were supposed to do, you wouldn't have to see the data that is being send to the printer go via the TV screen.

CU Mathy van Nisselroy

PS yes I'm a weeee bit p***** about this.
Maybe that's because I've got three of them, wanna upgrade them, but don't know how. (Mr. Woolley's TTL connector is already connected)

My dad has a leftover case for when we re-built a defective 1050. I'll
have to ask him if it has the name plate on it or not though.

Laters,

antbaker@arn.net

Hi Guys--

There's a cool utility called WEBZIP that can archive a web site into a single (zip) file for you, allowing you to browse it on your local machine. I use it alot for the situations you talk about. Have a look at it-- maybe it will work for you too :)

Cheers,
Steve

In regard to all these floppy problems between you two... could you
tell me if you were trying use 1.44MB disks as if they were 720KB
disks? Lots of people mistakenly think that because the 1.44 is
designed to hold more, that it is more than fit to use as a 720.
This is completely false. You will get errors up the butt doing that.
They are apples and oranges, not high quality oranges and lesser
quality oranges.

Bob's Black Box only does 19.2Kbps MAX (and then only reliably with a
proper handler which uses hardware handshaking lines). I still say
the best bet is to use a 14.4Kbps modem with compression. That should
easily provide 19.2Kbps throughput. Or, as an alternative, use a 28.8
modem and limit it to 19.2Kbps with no compression.

Anything more is okay but a waste of money or resources.

You got that right. I think I paid like $30 for my BB case (site unseen). What a piece of trash. Flimsy, doesn't even fit together properly. I have no doubt that due to Bob's smaller type operation, and that I'm sure he had to job out the production (unless he has his own injection molders which I doubt) that is the reason for the cost. In other words like you hint at, Bob probably had to ask that much due to what it cost him to have them made. Doesn't change the fact that they are crap. The BB itself is wonderful and I praise Bob for that. The BB is after all the important part.

So, to anyone considering a BB or whatever... do not pay more than $5 for a case.

> from the modified list. It really doesn't take all that much time.

I remember when I was over at a friend's house and we decided to play DOOM
via network cards rather than the usual MODEM connection.So we put a card
in and ran the auto-installer for the networks software and then got
a "EXE header corupt" (or some such) error.It turned out that I had ran
out of disk space and the installer hadn't even noticed.It had blindly written
out the files without checking the "number of bytes actually written" number.
(MS-DOS works like the Atari in this respect but no error is actually returned)

And Net-Tamer,a jack of all trades sort of programme to get on the Internet
via PPP,won't return *ANY* error at all when you try to write a file to a
sub-directory file.(which would return the catch-all "ACCESS DENIED" error)

I find that most MS-DOS programmes either give some vague,meaningless
indication that something went wrong,simply say "File not Found" for all
errors,or don't indicate errors at all.
(of course the same goes for Lynx,but that has to do with the WWW,which has to
do with GUIs,so Lynx is inherently cursed.Thank GOD that I use WWWOFFLE!)

Actually, the Gumby upgrade grafts a second POKEY into your system, giving
stereo sound with 4 voices per channel. Another upgrade (from AIM magazine)
put a second PIA into your system, for a parallel interface or additional
memory.

But none of these mods have achieved widespread acceptance, so programming
for them is rare - why write software that only few people can run?

Source record: 56288

I bought another 130XE the other day and took it apart for case cleaning (my standard for new purchases) and noticed soething strange around the SIO port. there are what appear to be diodes or resistor soldered to the bottom row of pins on the back of the SIO port and then they are soldered to the strip where the RF shielding attatches. What benefit does this give the SIO port, or what the heck was the previous owner trying to do?

thought i remembered reading about sio mods before but can't remember were to verify, any help, or the site describing these mods would be appreciated

: drive? What?

: Laters,

: antbaker@arn.net

The black box allows you to hook up SCSI drives, 14.4 modems,
printers....some models have a printer buffer and there is a menu which
has some utilities with the "Black Box Enhancer"....the enhancer comes
with the Floppy board or is an extra 50 bucks. It allows you to do sector
edits, floppy backups etc. The Floppy Board is a device that plugs into
the BB, and allows floppy drives such as 1.4, 1.2, 360k 720k even 8 inch
floppies to be used with the BB. There is also a utility to read/format
IBM floppies but I seldom use it.

All in all, it is a nice piece of kit. Why does it cost so much? It is
custom built and ordered in small batches. Oh yeah, there is a real
expensive cheesy case for it too that many are pissed about buying when
they buy it....otherwise it is open to the elements.

Hope that answers your question.

Willy

>
>uh,what's F5???

You must have missed the first msg Daniel, I'm trying to figure out if
the Atari emu's are not resetting correctly. The F5 is the reset key on
the PC versions.

I know you run a real Atari and so do I but not an 800, mines a 130XE.

>(There are only four Atari function keys)
>Well when you press RESET the OS ROM is switched back in so there's really
>nothing to be done for it.The 800 OS gets replaced with the built-in one.

What should happen on the emu in 800 mode is that if 244 is set and C,D
contain the pointer to the code then a WARMSTART should rerun your code,
on the emu's its causing a full Coldstart and jumping thru $E477..

Hence the question since I cannot test the 800 mode on a real machine

Yup. Would like a list.

Especially looking for:

Atari OS Source Listing
Programming the 6502
Mapping the Atari (Revised XL/XE Edition)
Atari BASIC Source Book
BASIC XE Manual

i have one but it only works in the 5200 with 2 controllers not the 4 controller one

so if you want it its yours for $30 shipped yes it works but you need to have a 2600 joystick

If it is what I think it is, it is almost a full blown 2600 in there. I
think it has a 6507 etcetera, only parts I think they eliminated were a
few things like the power supply since they use the exiting 5200's
supply IIRC.

It's not giant. It's about 3"x3". Unless you mean that big spinning
thing in Hellraiser 2, and that's diamond shaped.

Well since mail directly goes from the sender to the receiver and then just
sits on their UNIX host taking up room,I don't much see your point.
It doesn't go all over the place like news does.

It should work the same on all Ataris.

> The reason I ask is that all the versions of the A800 emu do the same,
> if you find a reset proofed program in XL mode and hit F5 it just reruns

uh,what's F5???
(There are only four Atari function keys)
Well when you press RESET the OS ROM is switched back in so there's really
nothing to be done for it.The 800 OS gets replaced with the built-in one.

>What is the JAM!!?

The JAM!! is a composite video to VGA
convertor that is AMAZING. It changes the
fuzzy, grainy, lined color composite image
into a beautiful VGA image that is oh-so-much
better. It's made by AIM labs, and retails
for ~$80.00. It is sold at some Electronic
Botique shops. It has provisions for regular
composite input or S-Video for the best image.

>for a case.

I have a "virgin" BB case for sale if anyone wants it. IMHO the case has
negative value
if you use a FB, since the BB and FB sit
chip to chip (not quite touching) on top of
each other. Heat is a problem, and containing
that heat inside the shell is a very bad idea.

Source record: 56476

>In regard to all these floppy problems between you two... could you
>tell me if you were trying use 1.44MB disks as if they were 720KB
>disks?

Nope. HD is 1.44 and DD is 720. The problem most likely is the 1772-02-02 FDC
which is over-extended to do 1.44's. As I
understand it, many will, some won't. Note
that in my post, the 720 is the "good" not the
"bad". Nor do I use 720's as 1.44's, although
I did years ago with my PC, and found that
only the SONY disks that I used at that time were reliable in doing so. Most
720's
would not eve format.

In my case, (HD) disks formatted to 1.44 on the FB normally can't be read on
(several) PC
floppies.

So why don't I replace the FDC? Well, it's
soldered in, and since I use my ZIP...

Mathy is absolutely right about the BBXFER
program. If someone knows how read the
PC disks and would convert that to read
ZIP's, it would be a very worth-while project.

XM301 on a pc? i dont think it could handle all that speed.... only an 8bit could handle all that power.... ;')
i remember getting an xmm301 when they first came out.... and i remember when it first connected to a bbs and the text started scrolling down the screen.... didnt need drugs.... the high lasted..... i think its been 14(?) years now.... but i also remember atari screwed up.... they didnt use all the sio wires, and didnt trim them so they tickled anything they pleased inside... including shorting out the machine :'(

sloopy.

I may be a little naive when it comes to 8-bit upgrades, but what in the hell is the black box and floppy board you guys are arguing about and why does it cost so much.

Also, how would it help the 8-bits? Is it like extra mem.? Is it a RAM drive? What?

Laters,

From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <36971D8F.50F9@geocities.com>
Source record: 56480

Hey folks, I was amazed recently to find out that the Atari 5200 had a 2600 game adapter. Since I have been thinking how cool it would be to get 2600 game carts working on a Atari 8-bit, I was wondering if anyone could tell me ANYTHING about it.

How it works, if they had one and what it was like, if they've ever taken it apart... ANYTHING.

I would like to build a 8-bit version.

Thanks!

The man who is now blissfully browsing past the Dr. who discussion area.... :)

Doctor Clu

You probably did, since that's what happened :) Recent games include
Mace, SF Rush, and Area 51.

Last I heard, it was complete but couldn't be released because Hasbro
wouldn't dig through the stuff they'd bought in order to provide 4Play
with the encryption info needed to release the game.

Actually, most of the programming has to be done with real 2600s via the
Supercharger, as the emulators tend to be far to forgiving to use for
testing.

Well, not PD, but freeware. He still owns the rights to the AR
properties, since Alternate Reality Online is in the works. I gave up on
XL-It! when it stopped working on my computer (around 0.17). Anyway, AR
is tricky to use on an emulator due to the custom serial IO, display
lists, etc.

Oh,never use those auto-HTML generators.Netscape's version changes your
HTML tags into what the tag would produce when viewed by Netscape.
So it would change into and into .Of course &
look different under Lynx...
Just look at what is does to my poor HTML test file.
()

Well Lynx,of course.What else would a self-respecting Atarian use?
I just now tried it with Netscape and I can see why people would miss the
features list.It's so tiny!

> >And why would you need a 9600bps MODEM for Phoenix?

300BPS is more than enough if you simply want to stay in contact with someone
with Internet mail.

There's plenty of Internet programmes for IBM PC/XTs and PC/ATs.
And PS/2s and other 80386 systems can just run Linux or Net-Tamer 386.
(and the IBM-DOS Lynx)

> >And certainly Gr.8 will be useless for displaying most pictures.Better to

What FPU?

Why not just use mode 2 (Gr.0) if it's just going to be text anyway.Much
faster that way.And easier to see.

> Again, it would prove quite useful if I knew what browser/means you used to
> access the site, so I can evaluate the situation. But I won't be updating

I don't understand why you didn't test it with Lynx,the de facto standard
for Atarians.
(not to mention FreeNetters)

> the page again until I have the first phase of PHOENIX done, because I don't
> want to spend my time refining the page when I could be busy writing code on
> my Atari.

It doesn't take that long!
I don't know why you were talking about tables but HTML 2.0 is pretty
simplistic.I simply don't understand why there are classes for learning
HTML.Even the 3.2 tables seemed easy to understand from what I saw.
(but beeing a Lynx user,I obviously don't have much interest in them,
though I'm beginning to look in to Elvis for more HTML-viewing related
uses)

And they are kind of like the Cenobites from the Hellraiser movies.
And after Hellraiser 3 introduced the more skin-coloured Cenobites,
the second TNG movie gave us those "rotten corpse" Borg.
And the Cenobites are led by a big giant metal cube...

No Will,

A BB & FB & HD & Case all together IS reasonable, however you want $200 just for the Black Box, another $150 for the floppy controller and whatever else for the rest. That I find unreasonable for USED equipment that you buy for NEW for the same price.

Curt

I'm more pissed that they didn't make the damned things PBI/ECI interfacable. That joystick port kludge is a joke!!! If they had made it PBI, the drivers could have autoloaded and it would have been all ready to go. In fact the original idea was to have the Atari XM128 12" monocrome 80 column monitor have the XEP80 built in and plug into the XE (which way, they never specified, no work was even started on the XM128 except to give it a name and description). I'm disappointed that noone simple came out with a nice big empty metal box with a couple of slots like the 1090XL was supposed to be and then just built cards to plug into it, thats way the 8-bit really needed, or even better, an 8-bit motherboard 800XL/130XE with PBI slots on it for PBI device cards.

The Black box is one of the few Atari 8-bit enhancements still being sold. It gives an Atari 800XL or 130XE the ability to use SASI/SCSI hard drives, IBM standard disk drives (using the Floppy drive board) which are much faster then the standard SIO disk drives, 19.2k baud modem interface, buffered parallel port interface, built menu'ing system and debugger, its a very powerful and useful interface.

I tend to agree, I am pretty sure MSDOS, PCDOS etc, and Win HAVE lots
of error returning mechanisms but I think they are not used by coders
as much as they should be. Especially with Win. It's like the
attitude is that the operator shouldn't be unduely confused or
frightened by too much information (especially of the error variety).
That's one of the things I really appreciate about most software for
the Atari8, it lets the operator (oh yeah now a days it called a USER)
know what the status of things are.

There used to be a Gui for the 8-bits called Diamond which looked just like a low-res ST desktop. There is a software package called SAM (Screen Aided Manager) which is an 80 column desktop which isn't bad at all, its sold for $19.95, do a search around the web and you should be able to find it.

Does anyone have any documentation about the XL OS and how the different SIO poll types were supposed to work? I've been doing some disassembly and I've figured out part of it but I would like to know if there are any specs for the peripheral handler loader and how it does relocations.

I'm also interested in seeing if there are any specs on how the XEP 80 works. I'd like to see about emulating it in the atari800 emulator...

Any info would be appreciated.

The peripheral handler loader is just code to relocate device handlers and
install them in HATABS. It's fairly well documented in the comments of my
OS disassembly. If you want the whole disassembly, let me know.

Hello. Today is the 10th of January and the new postal rates are in effect,
so please keep the following prices in mind when buying or selling some old
computer goodies. I have listed the 1st Class (Priority Mail) shipping
prices for packages, with weight listed first, then the new shipping price:

2 pounds and less - $3.20
over 2, less than 3 - $4.30
over 3, less than 4 - $5.40
over 4, less than 5 - $6.50
over 5, less than 6 - $6.60
over 6, less than 7 - $6.70
over 7, less than 8 - $6.80
over 8, less than 9 - $6.90
over 9, less than 10 - $7.00

Trying to help out a little bit,

You need an installed handler to convert the joyport readings to keyboard
codes and stuff them into the CH register. It pretty well has to be done
during the vblank as the joyport cannot produce an interrupt.

If this doesn't get you on your way, let me know as I wrote such a handler
years ago and can probably still find the code.

Peek the joystick input port and you can map the values to the keys, they come in the normal joystick inputs. Or, maybe puzzle out the stick() values. A handler is certainly a better idea, but more complicated.

IIRC, you might have to look at the strig() inputs as well.

Just a little infinite loop that prints the contents of stick(0) is a good start.

I wrote a cricket scoring program while at school, using one of the keypads for data entry. Man, the residence hall manager was really pissed at us, seeing all the dart holes on the door on which we hung the dartboard!!!

416. Help: Edilon failure

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-10 00:00:00 UTC
From: "\"Please Send Your Spam To This Address\"" <spam@xmission.com>
Message-ID: <3699444F.62AB@xmission.com>
Source record: 56332

I just finished making an SIO2PC converter box so that I can use the APE ProSystem to back up all my 8-bit floppies. After copying the disks, I tested out the copies and they all appeared to be good except for the Edilon, which would show the Lucasfilm banner and then wind up with a black screen playing all sorts of random notes.

I thought this might have been a bad copy, so I tried loading the game from the original disk. Again it failed in exactly the same way! I know this game was working before (as least for the first 6 levels -- after that I got wothing), so I feared that the original disk has gone bad.

I searched one of the game archives on the web and downloaded the Eidolon from there, but when I checked the downloaded ATR image against the one I had made using ProSystem, they turn out to be exactly the same. So maybe the disk was still good after all.

But why doesn't it finish loading any more?

Does anybody know anything about the last version of ST Xformer? I now have a Mega ST4 as my main computer and I have a few XE programs I'd just as soon port over. Personalized business applications, mostly. I need BASIC to run, Turb BASIC would be even better, and Compiled Turbo BASIC would be fantastic. I don't care too much about speed or about games. I still have my XE, but some things would be more convenient on the ST.

Anybody know where I can get the last version? If I remember correctly, the author put it into PD when he quit working on improvements.

426. Re: XEP80 & JAM!!

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-11 00:00:00 UTC
From: sloopy_m@my-dejanews.com
Message-ID: <77bs0t$l0b$1@nnrp1.dejanews.com>
Source record: 56392

i think the joystick port was reasonable.....what about all of us with 800's
and 1200xl's? you want slots? thw 800 had 3 slots.... what they should have
done was made the 800xl more like the 800 (3 ram slots a cpu slot, and a rom
slot) and leave the 600xl they way it was as a 'beginners' or non-power usrs
machine. i made a drawing of what i thought the 800xl should have been, but i
did not work for atari so it is just another drawing...but yes i agree the
xep80 could have been better done... (i did acustom homebrew board (6502, 2-
6532's 1-6551 16- 6520's 16k ROM 16kRAM) for a freinds train setup and used a
xep80 for the video when it wasnt hooked to a terminal....) it could have
done color and why does everyone put parallel ports on everything? why not a
serial? with the sio it would be so easy its not funny....

i always thought that using the system was so slow in dos/win that most
programmers just coded things themselves..... and the error mech being done
last and they wanting the program done so skimp on it..... (with win i can
really understAnd it..... it coined the term 'same day service' with its
int's... ;') but with the atari's simplicity errors are easier to handle.....

428. Neglected Atari 1200XL just boots up to green screen: possibilities for repair?

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-11 00:00:00 UTC
From: bmw3@cec.wustl.edu
Message-ID: <369968e7.3409027@newsreader.wustl.edu>
Source record: 56394

After about 5 years of storage in my attic, I unpacked my 1200XL and tried to fire it up. On the first power-up, with no cartidge plugged in and with the 1050 floppy drive attached but no disk in it, I saw a blue screen with a small white box in the upper left corner. I vaguely remember this screen showing up whenever I booted from a diskette (when the Atari was working). However, the rainbow logo image never appeared, as used to happen whenever I turned the computer on without any cartridge or disk inserted. I turned the computer off and tried turning it back on with a cartridge inserted, and this time a pure green screen came up. Subsequent power-cycles with various other cartidges and disks seemed to have no effect. Even after disconnecting and reconnecting the power supply, disk drive, TV, and controller, I couldn't get anything but a green screen.

Would anybody have any ideas as to what could be wrong (i.e. fuse blown), or where I could at least start looking?

Many Thanks.

whats to think about? even a C64 is better than a pc (please note my 8bit preference is atari) i mean come on with the c64 you get a response in a few seconds... the pc is like the dry cleaners... same day service... in by 9 out by 5.....

(just could NOT resist.....)

>Both BB's have the Hardware-Flow-Control and "D9:" support of-course (not
>supported in older ROM revisions).

Ahhhh.... IO was wondering about that. I picked up on the fact that
the BB supports hardware flow control. I even got Len Spencer's
handler for it that uses the flow control. I have my BB hooked up to
my PC using a null modem adapeter and I have a LED status light
adapter hooked in as well so I can see what signals are doing what. I
thought it odd that I saw no activity on CTS/RTS and that my best CPS
rate when doing transfers from the 800XL to the PC was around 1700CPS.
Theoretically, it should be 1920CPS or slightly less to allow for
prtocol overhead. Now I see this message and look over at MY BB. I
guess I have an old bugger cuz my ROM has a white sticker on it with
"BB 1.2" on it.

What is the D9 you are talking about? Are you refering to a Dshell 9
pin com port? My BB has a card edge connector that I made a robbon
cable serial cable for.

I have three 8 bits usually running..one with a project going-
hardware or software(I have lots of those these days), one with
Paperclip, and one with a disk utils, Bobterm, or a game going.
I don't have any A8 emulators. My website is for the real thing.
While I sometimes agress that the emulator or For sale traffic
can overwhelm the NG, I'd rather have it here that have to hunt a
ll over the place for any info I need, or to be able to help
those I can.

A LONG time ago I made a dispatcher that could divide CPU time over two or more separate programs. Funny when the OS got e.g. 5% of the time and a simple endless loop the remaining 95%: the cursur click was now a sort of a one second farth. :)
The dispatcher was made for a planned but never finished music player with a constant CPU usage in each frame. It used IRQ's from the sound chip (forgot how they are called) or DLI's for the timing.
A context switch switched A,X and Y and the zero page.

Problem with running 'normal' programs:
- they should be 'relocated'
- or each program should not use > 4 16K banks, and switching could be done using extra memory banks. This would result in a very slow context switch though (1 second or more)

Or (forgive me because I am VERY rusty at this) was it the case that when changing banks, memory became available in the right place (3 banks <48K) and no copy is needed? In this case also the ZP doesn't need to be copied.

If anyone is interested in this dispatcher (working source in ATMAS II) I could dig it up and post a copy. (Hmm, but I do not have a SIO2PC sort of thing) So you should REALLY want it.

regards
Yeb Havinga

I'd like to emphasise that I would like to get rid of this lot as a bundle, rather than flog off separate bits. However, I've received several requests about what the "Tons of games" are, so:

Boxed:

- A huge number, which I won't list, of UK budget titles (Mastertronic, Virgin etc.) on cassette (there's approx. 30--40 of these things);

- LucasArts titles: Rescue on Fractalus (disk), The Eidolon (disk), Koronis Rift (disk) and Ballblazer (tape).

- Star Raiders II (final edition).

- Ultima IV

- Infocom's Hitch Hiker's Guide to the Galaxy, with fluff, peril-sensitive sunglasses and microscopic space fleet (includes Invisiclues hint book, but with clues revealed).

Unboxed:

- Several compendium disks, including things like Spyhunter, Chuckie Egg, Original (US) version of Star Raiders II, Spindizzy, etc.

Again, make me an offer _for_the_lot_ please. It's all boxed up and ready to go---all it wants is a home, and all I want is some money and postage on it.

Guy Bolton King.

My original disk is safe away while my happy drive backed it up. But
then I found another disk in my collection that said eidolon that works
just as well and also made a suitable .ATR file
I have had some success using a sector copier through APE and my SIO2PC
to make disk images. Works better than my happy or usdoubled 1050's

Ahh, come on. You can do it! Figure a way!

Some people have jobs where monitoring usenet is essential. I'm not
that lucky, but hey, I'm writing this at work right now, and the boss
knows about it! ;-)

Of course, I don't have 'Net access here, but I can't complain! I go
home and pack my disks with gzipped usenet and come back to work and
do what I'm doing now.

The best way to start is by replacing the LSI (the big ones) chips one at a time. Actually, the PAL chip - CO60609 is a good start. At least all of the chips are socketed..... If you get a blue screen and a white, square cursor, the memory, ANTIC, GTIA and CPU are probably good.

Rudi Niemeijer entertained comp.sys.sinclair with the following story:
>Everything is better than "10/10" the ZX-81 uses to say.

Not really, since if it says "5/80" you know that the error is on line
80 of your program and you can look up error 5 in the manual to get the
explanation of precisely what is wrong.

actually, it is even worse than that, I think. the controller comes with an internal font on ROM which looks like it is trashed. I suspect that Atari picked these up as junk devices that had bad programming..... nice.

There are drivers for the CX-85 numeric keypad around. Some might be at UMICH. I remember typing in tons of ml listings using one of them.

Now that I think of it, Frank Walters, an OHAUG member, wrote some specialized CX-85 drivers to work with TextPro and BCalc, and they can be customized for other uses, as well. Since you're an OHAUG member too, just contact our disk librarian (snail mail unless he gives out his e-mail address and ask for them.)

Actually I have the original prototypes of these beasties, I'll pull them out, take some close up shots and put them up on the Atari Historical Society website in the Atari XE section, I'll do it this comming weekend. Its true about the XEP80's they are just crippled kludges. Why oh why couldn't the Tramiels have done just one or two things right with XE line, such a waste....

I have some very nice book on that and related subjects as well. I do
not have that particular title, but i do have some good books. Drop
me a line if you are interested enough to know what I have. I would
probably be willing to sell cheap. I think my Atari8 programming days
are over but I still like to USE it. I can't seem to find my OS
Source listing and hardware manual from Atari. I suppose they could
be part of what I lost in hurricane Andrew. I did happen to see Atari
Roots in a box. I know my 6502 Assembly Language Programming by Lance
A. Leventhal was ruined and I no longer have that one. That sucker
was the GOD of all 6502 assembly books. Atari Roots is supposed to be
one of the best assembly learners books while Leventhal's book was a
comprehensive reference.

I have other great books too. Stuff that uses BASIC even.

.. or, you could try connecting the 130xe to your VCR using an RCA (audio/video) type cable .
the VCR (video input) accepts the Atari 130xe computer's RF output feed and allows you to view the output on your regular TV !

Jay Minor headed up Steve Mayer, Nile Stohl, Joe Decuir who designed the Atari 2600. Jay then lead the group that designed the Atari 400/800 chipset.
Nolan ran the company, he didn't design the chips.

Yep, Jay and team designed the hardware in the Atari 8bits and also did
the hardware for what would have been the New Atari's, otherwise known
as the CBM Amiga.

The dopey Atari folk had a falling out with Jay's team and off went
their creation to CBM...

Another Atari ball's up!!!!

Sadly!

If you drop the XL OS compatibility, the actual process context must
contain:
- the zero page
- the stack
- the registers

Designing a format for position independent executables is not a big
deal.
Actually, one is already invented (SpartaDOS X system software, that one
which is found on CAR: device, is in position independent binaries). No
program has to be moved in memory once it is loaded.

If you want to keep XL OS compatibility, you have a problem :)

- process context must consist of same as above, plus many more
XL OS variables, f.e. IOCB blocks & such stuff.
- this is basically about (say) 1024 bytes. So any context switch would
mean
moving 2048 bytes across the memory (1024 bytes to save current
context
and another 1024 to build new context).
- the CPU best case for moving 1024 bytes is:
256*7+768*8 = 7936 clock cycles
So each save/build context operation would take 15872 clock cycles.
- assuming 25 switches per second this takes away 396800 clock cycles
out of
approx. 1790000 total, which is 22,2 %
- notice the Antic already takes away about 35% of bus bandwidth, which
reduces the effective processing power to about 1160000 clock cycles
per
second. So, the real CPU time reduction would be approx. another 34 %
(396800 cycles out of 1790000 minus cycles stolen by Antic for screen
DMA
and memory refresh)
- this is best case which is rather impossible. Any real scheduler would
take much more CPU time, but say.

- the whole thing with contexts being 1024 bytes big is because the XL OS
is not reentrant, i.e. for example, you can't call CIO from within a CIO
handler. And this would be the case, if a handler would get preempted, then
another program granted the CPU time would call the CIO vector. Confusion, mess,
crash.
- another solution would be (instead of moving 1k contexts around) to block
the scheduler when the CPU is executing OS code, or at least when it is
executing device handlers. Thus there would be no multitasking at all,
because normally the CPU spends most of its time waiting for keyboard
input, in the keyboard handler in ROM.

Next problem is that XL OS contains busy-wait loops inside it. To run efficiently
it would have to sleep that time instead of looping.

I mean, XL OS is really a good piece of software. It contains almost no bugs,
is well rethought and well written, contains all useful services and is also
expandable enough.

But also, really, it is defintely _not_ designed to run in multitasking.
There may be some hacks like switchers and dispatchers, but if anyone could
try to use them for daily 8-bit computing, the uptime would be much much much
shorter than "downtime" :)

I know about multitasking systems for C-64, but afaik none of them assumes
compatibility with the usual C-64 "operating system".

Of course, nothing is impossible. The XL OS could get completely recoded
(*from scratch*). However, there are still problems with its "public" data
structures, such as DCB and IOCB, which are either global for all programs,
and positioned at fixed locations in memory. Now imagine two programs
opening SAME channel for two different operations...

And Unix for 6502... well, I guess that some very simple, limited Unix
parodia for just one user is possible and would run rather well. Also might
be an interesting problem to code. But "true" Unix, even very small, seems
to be hardly possible. You know how long are gcc executables? I mean the

compiler, linker, assembler, preprocessor... without that it wouldn't
have
access to Unix software (provided that ther's some compatibility). And
what's the advantage of an Unix without Unix portable software? :)

Dude, as I explained in the ST newsgroup, the Milans, Falcons, etc.,
run ST programs. They run ST TOS programs. They run ST GEM programs.
They ARE STs. They are enhanced STs, evolved STs that can still run
the same programs that run on the earliest 520 ST.

Hi, Doc (I'm still working on the Monkey Wrench II documentation for you. I just keep getting sidetracked).

The 2600 was built around a similar architecture, but in the end it was quite different because of its simplicity. Quite a few 2600 games were ported to the A8 machines (most were concurrent releases, not true ports). Activision had most of their line available for the computers. The 5200 was also similar architecture, and there are a few conversions of 5200 games that appear on the internet (Centipede was one I remember -- in fact, I think the 5200 port plays better than the original A8 version), but there aren't many, since it's rumored that the conversion programmer was one of Atari's own defectors, and he/she has never revealed the secret behind the cross-platform cracks.

Other, more technical minds, could provide the schematic differences. My info comes 3rd-hand, mostly from past discussions of this same topic.

W2000, NT5.0, whatever you call it, is shaping up to be a huge
resource hog. Prepare yourself for a 500MB chunk of hard drive just
for the Windows files, and a 64MB Ram requirement for minimal
operation on a Pentium 300.

Win98 isn't all that great either. Every 98 machine I've added to our
network has had some kind of problem, mostly with networking or with
dial-up communications. Some of them have even rejected the network
cards, and reinstalling doesn't fix it. Microsoft urged businesses
not to buy Win98 in favor of NT Workstation, and I can see why.
Unfortunately, I'm just the network guy; I don't get to decide what OS
goes on the pc.

I have to turn on my 800 or my 130XE just to get back to a sense of
reality. 1.8MHz really will run just about everything you really
need, as long as it's an Atari, right?

you will not in practice get any object which is an exact integer number
of pounds.

Think not? Well, just increase the precision and accuracy of the
measurement, and
you will come up with a integer-breaking fraction of a pound
somewhere...

If your package is ~really~ close to an integer weight, well remember we
can infinitely
increase the precision of our measurement. (Measurement accuracy
notwithstanding).

Taavo :)

Since I got a TT no version of ST Xformer I could find worked so I
tossed it. I heard a TT compatible version existed however in order
to make it run the author in his infinite wisdom simply diabled the
cpu cache on the processor rather than recode it properly. Duh! Then
he jumped platforms... I never bothered to locate the last version.
I did at one time run ST Xformer on a MegaST4 but I have since sold
that.

Draco has released an emulator that looks promising, but it requires a
TT or falcon to run. It will even use the FPU in the real machine
under emulation for some really amazing 8-bit benchmarks. Turbo Basic
runs on it anyway.

Jack Trammel, died several years ago. I don't know what his sons are doing.
Jack was a cool guy. Had a few beers with him at a christmas party once when I worked "for" him as a CMOS layout engineer with STYRA Semiconductor (an Atari subsidiary). He (Jack) spent his childhood in a concentration camp-- pretty rough. -Pwess

The XEP80 uses a slow serial-like transfer from the joystick port. I once
made a cable that connected from the Atari joystick jack to the
PC printer port and sampled the output for display on the PC screen.

Sort of useless but it worked ok. I'll see if I still have the code for that.

But it doesn't have to take the shortest route. And even if it does, it takes up space. Minimizing this space/time one message uses will leave more space/time for others. Packages of bytes are send over the net constantly. If you make a message as small as it can be (without ofcourse leaving stuff out that should be inthere) these packages get smaller. (maybe you could compare the net with the snail mail system (but on steroids) and Email as mail (on paper and in boxes, not electronic). The mail system would have to bring all you packages in pieces (data packages are send in chunks of a certain size). If the mail chunks are smaller, the mailman would be at your mailbox sooner, since he doesn't have to give your neighburs a lot of packages.

However infinitesimally small the chance, it is still possible a package
could weigh EXACTLY an integer number of pounds, no matter what the
accuracy. But the package would have to be weighed quickly before even
1 microscopic dust particle fell on the box while it was on the scale.

You missed something. Try
http://www.emulators.com/freefile/stxf300.zip
That is not real hard to find if you just look around for a minute or
two.

On 12 Jan 1999 01:57:35 GMT, atari@bright.net (Lonny Pursell) wrote:
>Since I got a TT no version of ST Xformer I could find worked so I

>I did at one time run ST Xformer on a MegaST4 but I have since sold
>that.
You cannot blame Darek for a cheap solution if he made it freeware.
Maybe we should be glad he did anything at all for no payment.

Anyway, to expect people that are in this business for a living to
support a platform that will not bring in lots of money is silly.
If you look at The I-mac, people are griping about this too.
Wake up to reality. The I-mac. the TT, the Falcon, all these
machines will never ever see the support that the PC currently
does. Software developers like a standard platform. Mr. Gates
effective provided that, while others were trying to make their
proprietary operating system be accepted as standard.
The only way any non-PC stuff will survive is by people that just
use their systems for the fun of it. That is why the Atari 8-bit
system is still alive. Not because software developers keep
writing new and improved stuff, but we bacause we like using
our systems so much. I still use my Atari ST-Book every day,
and it is seven years old, and at 8 Mhz, extremely slow, but it
suits my needs. So does the Atari 8-bit. I love it, and it bring
me joy to use it. At work, I need something that runs the
standard applications, also provided by Mr. Gates. Who needs
joy at work? Wouldn't it be nice to have Atari stuff at work?
To get back on the subject, the source is available for download

too, at
http://www.emulators.com/freefile/stxf3src.zip
so just download it and modify it yourself then, or find someone
willing to spend time on it.

Ayway, my two cents worth.
Keep those XL's/XE's humming.

Technically, there is a emulator group where these things should be
discussed. If it is just about pure game mechanics, maybe it would be
appropriate here or in the CBM group.

Problem is, 90% of the questions are ~"Why does Bounty Bob Strikes Back
crash <insert emulator of choice>?". Clearly outside the charter of the
newsgroup & it would be more appropriately placed in the emulator newsgroup.

It is the nature of the beast that people would rather post to a less
appropriate newsgroup & get answers vs build up the appropriate one. The
emulator newsgroup is pretty deserted.

Posted with Ink Spot (for the Newton)
@>-->--------------- / | \

Well, i'll be looking forward to the docs once they are posted. Mainly interested in getting some cartridge to do SOMETHING in the right cartridge slot. ;)
As forthe cross platform ideas, itseems that playing 5200 games on the 8-bit is very possible, just need to reprogram the code on the controllers. I'm just thinking .. dreaming.. on a way you could make an adapter that plugs in 5200 cartridges, and filters the control output so that it THINKS it's operating a 5200 controller, but have it convert the signal for a regular joystick.

Ah.. this may be true, but Amstrad has stood the test of time. Will
Playstation be doing as good in 10-15 years?

Welcome back. You remind me on why I follow the e-bay. to attract
users like you.
I myself was into the Atari till 1989.. went to college, came back,
and in 1998 found that a Atari community still existed. Found this place
to be a lot of fun, and my local Atari user group and webpage at..

http://www.atariusers.com/aunt

Again, welcome back to the world of Atari. :)

Doctor Clu

I think the only thing that cares what year you're in is SpartaDOS and I seem to remember the release notes for 3.2g mentioned it was all ready for 2000.

> On a similar subject, has anyone got one of those plug-in clock cartridge
> things for the 8-bit (can't even remember what they are called). And does it

I seem to remember Rich Lawrence (of atari800win fame) saying the RTime 8 was not compliant. Without fishing around in additional registers of a real cartridge, I can't be sure though. From the work I did adding RTime 8 emulation to the emulator, there are several registers that are unused that could theoretically contain the century in them.

It's fun to split hairs... sometimes. However in this case, it's a
little pointless. Scales, as measuring devices, all have FINITE
accuracy, and round off to whatever that accuracy happens to be.
Therefore, an exact number of pounds is quite possible. And, it would
take a very sensitive scale indeed to register the difference of a
single dust particle! :)

I am looking to sell or trade all of the following. I am looking for Sega Genesis carts that I do not have. They must have at least the box, if not box and docs. I will use what Funcoland sells the title for as a trade value (i.e. if Funco sells them for $9.99 then I will trade you $9.99 worth of stuff I have listed.)

Feel free to make offers on anything.

TurboGrafx-16 Games

Hit the Ice , like new with jewel case, game and docs $8 plus shipping
Jack Nicklaus Turbo Golf likenew with jewel case, docs, and game $7 plus shipping
Sinistron like new with jewel case, box and docs $9 plus shipping

Milton Bradley MicroVision Unit and Games

Original unit in box with docs $25 or best offer

Title	Code	Docs?	Have?	Box?
$35 Alien Raiders	4176	Y	Y	Y
$20 Baseball	4063	Y	Y	Y
Incl w/ unitBlockBuster (Incl. Unit)	4952	Y	Y	Y
$15 Bowling	4972	Y	Y	Y
$15 Connect Four	4971	Y	Y	Y
$35 Cosmic Hunter	4177	Y	Y	Y
$10 Mindbuster	4976	N	Y	N
$15 Pinball	4974	Y	Y	Y
$15 Sea Duel	4064	N	Y	Y
$10 Star Trek Phaser Strike	4973	N	Y	Y
$ 7 Vegas Slots	4975	Y	Y	N

CD-i "Games"

Harvest of the Sun with box and docs $3
International Open Tennis with box and docs $3

Prices do NOT include shipping.

Feel free to make an offer on any or all.

Atari 8-bit Carts/Disks & Manuals For Sale
Atari 8-bit Hardware, Books, etc for sale

Cartridges

All loose cartridges are $3 unless marked

EXCEPTIONS:

Carts with docs but no box add $1
Carts with box and docs add $2

Title	Manufacturer	Docs?	Box?	Price
Astrochase	ParkerBros	N	N	$ 3
Atari Artist	Atari	Y	N	$ 4
AtariWriter (version A)	Atari	Y	N	$ 3
AtariWriter (version C)	Atari	Y	N	$ 3

I got *seriously* lucky on this one, the bosses asked for a spec on a couple of machines and, to maintain compatibility with a machine already in place, I listed Windows 95. When they said "do you not want '98?" I told them my opinions and they took my word for it.

> I have to turn on my 800 or my 130XE just to get back to a sense of
> reality.

There are a C64 and a C128D to my right, powered up and doing stuff right now. And I carry a Zip disk around with a C64 emulator and some image files on, my bosses don't know this but yesterday I wrote almost an entire intro for the diskmag Vandalism News on their P200MMX. During my lunch break, *obviously*... =-)

Source record: 56363

Hello to everyone! I am posting this message on behalf of a good
friend of mine who is an avid user of Atari 8-Bit systems. He doesn't
have internet access, but he has a local BBS, and I grab the messages
and send them to him.

From shawnm@noisemusic.org Sun Oct 25 15:01:47 1998
From: shawn <shawnm@noisemusic.org>
Newsgroups: comp.sys.atari.8bit
Subject: Zaxxon question
Date: Sun, 25 Oct 1998 15:01:47 -0500
Organization: CiteNet Telecom - Commercial Internet Service

Hi. Was Zaxxon only released on cassette for the Atari 8bit
computers? I
have the cassette version and it doesn't load anymore (maybe the tape
is
dirty or stretched?). I'd really love a cartridge version - was one
ever
released? If so, where could I buy one? (I looked at some of the
usual
online stores already)

Thanks.

Shawn Mativetsky, B.Mus ___ *
percussionist (\ _/
shawnm@noisemusic.org __/
http://www.noisemusic.org/shawnm/ \/^\
____/ /

ok Shawn heres a list of ATARI bbs's that may have ZAXXON and other
game files you maybe interested in.
the first one is my BBS and I do have ZAXXON and ZAXXON 2 in the games
sig.

HELL BBS Berwick,Pa.
717-759-3372
11pm-9am (eastern time) 7 days a week
300-14.4 baud
currently 20+ megs of files and still more being added as I dcm a lot
of my disks and upload them to HELL's 25 file sigs and HELLs also part
of the east coast Express-PRO NET and looking for other nodes to net
with.

New Nest BBS long island NY
1-516-783-4634

300-14.4 baud
24/7

he has about the same amount of files as I do on his system, but he
has more PC files then I do(I don't want to waste disk space)

OMEGA BBS miami Fl
1-407-737-8704
300-14.4
24/7
20+ megs of atari files and a member of the east coast PRO-net

Repairr Shop BBS reno nv
1-402-
300-14.4 baud
24/7
currently he doesn't have most of his files collection of files on
line and I think he has a web site, but I don't know what it is, hes
also the current publisher/aurther of EXPRESS PRO 5.0b

If one bbs doesn't have the file your looking for then one of the
others will
happy hunting.
and don't forget GO TO HELL.....))

Hello to everyone! I am posting this message on behalf of a good
friend of mine who is an avid user of Atari 8-Bit systems. He doesn't
have internet access, but he has a local BBS, and I grab the messages
and send them to him.

From shawnm@noisemusic.org Sun Oct 25 15:01:47 1998
From: shawn <shawnm@noisemusic.org>
Newsgroups: comp.sys.atari.8bit
Subject: Zaxxon question
Date: Sun, 25 Oct 1998 15:01:47 -0500
Organization: CiteNet Telecom - Commercial Internet Service

Hi. Was Zaxxon only released on cassette for the Atari 8bit
computers? I
have the cassette version and it doesn't load anymore (maybe the tape
is
dirty or stretched?). I'd really love a cartridge version - was one
ever
released? If so, where could I buy one? (I looked at some of the
usual
online stores already)

Thanks.

Hello everyone,
I had an old Atari 800XL when I was younger and I found one on Ebay so I snarfed it up. I can barely remember how to get it working, but I popped in the ole SpartaDos disk and it worked. I was really shocked that those old disks would work at all.
I am excited to find this newsgroup and hope to be an active member!

Happy New Year Everyone,
Michael

I have a new Atari 800XL that I bought in auction and I was wondering if anyone out there was interested in swapping discs. I have several that I haven't even tried to see if they all work. Most haven't been touched in ten years.

Please email me. I live in Virginia, anyone nearby?

Michael

A very interesting question. I have a tendency to use a wide assortment
of computers depending on the need. I'm currently composing and sending this
letter from a Newton messagepad. (grin) But I'd like to try reading and
writing newsgroup messages on the Atari 8-bit.

Which brings up a up point.. what is a good newsgroup (and E-mail) reader
for the Atari 8-bit?

DoctorClu

Who currently uses his Atari for a cassette player and game machine.

Webzip!! Cool... I have seen the reseult of that (whole CD archieves from
a program like that) and always wondered how they did that. Does it capture
the source and then rebuild it all in a HTML environment off line?
Anyway, where can I find that doo-dad? :)

No. If you're going to hook up RF output, run it into an F-connector
(cable TV type). If you want to use the VCR video input, feed it from the
computer's monitor port (the 5-pin port) using an adapter cable.

The VCS was the original name for it when it had that crap faked wood look that Americans seem to love. Later versions were called the 2600 and had different casing.

Source record: 56377

Howdy folks

Yesterday my Harddisk started to act up. Lookes like my Flatcable doesn't like it when I move my computer around :-(((I need to move my computer since I have to study on the same desk.

So I'm looking for something I can stick it into.

- The original BlackBox case is NO option. (Too expensive, too ugly, my FloppyBoard sits "one chip socket's height" higher over the BB than it used to be, etc, etc.)
- A PC tower is no option, because I can't get to the switches and buttons.

What I was thinging of is a plexyglas case (see through), with slots/holes for the switches and buttons and "external type" connectors, so the strain is on the case and not on the BB connectors. Does anybody have an idea how much this would cost (do it yourself price, not injection-moulded or something (unless the price is right, ofcourse :-)))

CU Mathy van Nisselroy

530. replacing the co25953 (130XE gate array)

Newsgroup: comp.sys.atari.8bit

From: nisse-ma@reze-1.rz.rwth-aachen.de
Message-ID: <77i51gqsh2@nets3.rz.RWTH-Aachen.DE>
Source record: 56378

Howdy folks

To make my 1MB SIMM upgrade a bit cheaper for those who have no 130XE motherboard I need to know the following.

Is there a chip (or a combination of chips) that will give me the following:

(PB5 AND HALT) OR (PB4 AND NOT HALT) = CASBANK

Anything else should result in CASMAIN.

(co25953's cost US$10.00. 74LS chips are cheap)

Is HALT HIGH or LOW when ANTIC wants/has the bus?

Does the upper part of the CO25953 (the A14, A15, FA14, FA15, BA14 and BA15) influence the status of CASBANK or CASMAIN? (there is some influence the other way around. If somebody wants to know, I'll answer that later,)

I was thinking of an LS51 and two invertors myself.

Does anybody know if there are chip sockets that let you plug chips in them AND at that you can connect wire to. I don't want everybody to solder wires to chips.

531. converting a NTSC Atari to PAL

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-13 00:00:00 UTC
From: Christof Odenthal <Odenthal@AnySIM.de>
Message-ID: <369C980F.1E6B@AnySIM.de>
Source record: 56379

Hello,
does anybody know how to convert a NTSC Atari 130XE to PAL ?
In a circuit diagram i found some components (oscillator
stuff) which must be added for the "international" version.
I've done that but the system variables still tell me that
i have a NTSC Atari and there is only a black and white
picture (on a PAL monitor) when i turn it on. Does anybody
know how the Atari determines the display type (NTSC/PAL) ?
Does it count clock cycles, is there a (hidden) wire
connection i have to open or is there a specialized chip i
have to replace ?

thanks,
Christof.

Source record: 56382

Hi folks

Has anyone checked out their Atari 8-bit software for Year 2000 problems? I'm putting together an article on this subject but obviously I don't have access to every application. I've already come across quite a few that ask for two digit date inputs and don't cope too well past 12/99. Any known problems, please let me know.

On a similar subject, has anyone got one of those plug-in clock cartridge things for the 8-bit (can't even remember what they are called). And does it cope past Y2K?

Regards

echlo

i'd like to invite all of you to atari8-l mailing list.

it's probably the biggest atari 8 bit related mailing list in the world -
- connected bidirectionally to old list at MARIST, and gatewayed to the
FidoNet(tm) international ATARI8-L echo.

for now it has about a 100 subscribers, from all around the world. the list
is free from all the F/S messages, and other off-topic discussions, so
you can find there pure atari8 related stuff... all the messages comes right
to your email account, so there is no need to contact a newsserver, there
is no old-messages deleting, and so on... my wish is that every atari user
would be subscribed, so the atari community stay together and grow in
strenght.

if you maintain an atari8 related WWW site, please put some informations
about the list on it - i'll help others - not everyone has access to
usenet.

to subscribe, please send the message to majordomo@zwieracz.ideefixe.nom.pl
with the following line in the body (not the subject) of your message:

subscribe atari8-l

the language we use is, of course, english. the list is fast, reliable,
regularily maintained.

please, share this message with all people that are interested in atari8
topics you know, and help make this mailing list wide known.

I do believe Zaxxon was also put on disk. Well, I have (or had) a copy
of Zaxxon and Zaxxon 2 on the same disk. I'll have to have my dad check
out the inventory.

No disrespect to XL-it but you really should get Atari800win or the dos
version from www.davesclassics.com....

You might even find some Atari stuff on there, might not tho

540. Re: Wanted info Atari 400/800 power suply

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-14 00:00:00 UTC
From: Alex Taylor <Alex.Taylor@zeem.demon.co.uk>
Message-ID: <916272598.25719.0.nnrp-10.d4e49a43@news.demon.co.uk>
Source record: 56206

Hello all

I work in a computer shop (PC-based), and a customer brought in a boxload of Atari stuff, an 800 with tapes, cassette player, magazines, books etc, wanting it fixed.

Being mad on old machines, but not having much experience with Atari's (I have two 65XE machines but no software, and an ST), I offered to try and fix it.

The first problem is that the PSU is broken. The unit being used was the adapter for a Grandstand games console, probably inadequate for the job, and was blown. Therefore I need some more info in order to see if the machine works at all.

After reading an earlier message, I think the computer needs 9VAC and 3.4A. Does this mean that if I use a universal adapter, I can use any polarity without killing the machine? I know this is true with some other machines using AC (Vic-20, Acorn Electron). I need to make sure so I don't break it, since it's not mine, and I don't want to anyway (I want to play with it first).

Any help anyone can give would be very much appreciated.

Alex Taylor

You seem accidentally to have cross-posted to a newsgroup where
most people are more interested in 32-bit computers. See if
you can guess which one. (Hint; it's not in the Newsgroups: line
any more).

Hello

You might be thinking of "Scraper Caper" where Bounty Bob was a fireman that had to put out blazes in high rise buildings.

Seen many ad's for the game but never seen the game itself and not sure if it was ever released.

>I'm sure Jack will
>be very sad to hear he's dead

Hi Curt-
Jack's still with us? Great! I didn't think he
had passed on. I have a genuine
fondness for the Tramiels. If it had not been
for Jack, in all liklihood we would not be
having this discussion today! Unfortunately,
Jay Miner did pass away. I have read
ZAP!, and although fascinating, much to my chagrin it is basically devoid of
any of the
history about the computer & Tramiel era.
I'd love to know more... The "Home Computer Wars" gives a lot of insight into
Jack & Commodore. A lot has been written
about the two Steve's and Apple, but so far,
no definitive work about the A8 and the
men behind it.

A slight off-shoot of this hooking up a 130XE:
Anyone ever notice how crystal clear a SNES
is hooked up to a TV using its RF modulator?
We hooked up my grandson's to the same TV
(old 15" Sony) as a video upgraded 130 XE was hooked up to. Comparing that to
the A8 is no comparison. Anyone care to speculate (or illuminate) as to why?

550. Books possibly for sale

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-14 00:00:00 UTC
From: jmelbo@pressenter.com
Message-ID: <36a283f4.18937398@news.pressenter.com>
Source record: 56216

Hi all... okay about the books. I have found some. I list them here:

MAPPING THE ATARI
IAN CHADWICK
COMPUTE BOOKS
194 PAGES
YOU ALL KNOW WHAT THIS BOOK IS!

PROGRAMMERS REFERENCE FOR THE ATARI 400/800 COMPUTERS
DAVID HEISERMAN
SAMS
494 PAGES
LIKE THE TITLE SAYS; A LOT OF INFO

THE ATARI EXPERIENCE
ADRIEN Z. LAMOTHE JR.
DATAMOST
200 PAGES
MOSTLY BASIC ORIENTED

ATARI GAMES AND RECREATIONS
HERB KOHL, TED KAHN, LEN LINDSAY
REWARD BOOKS/RESTON PUBLISHING/PRENTICE-HALL
338 PAGES
A TUTORIAL ON SOUND AND GRAPHICS, PRIMARILY WITH BASIC
BOOK IS MISSING OUTER COVER BUT ALL PAGES ARE INTACT IN THE BINDING

ATARI XL USER'S HANDBOOK
WSI STAFF
WSI
360 PAGES
GENERAL INFO AT AN EASY TO UNDERSTAND LEVEL. COVERS BASIC COMAMNDS,
DOS ESSENTIALS TO KEYBOARD CODES. A LITTLE BIT ABOUT EVERYTHING.

THE ATARI BASIC SOURCE BOOK
BILL WILKINSON, KATHLEEN O'BRIEN, PAUL LAUGHTON
COMPUTE BOOKS
296 PAGES
IF YOU DON'T KNOW WHAT THIS IS, YOU DON'T DESERVE TO HAVE IT!

ATARI ROOTS
MARK ANDREWS
DATAMOST
288 PAGES
THIS IS TOUTED _THE_ TUTORIAL FOR NEW ATARI8 ASSEMBLY CODERS! A
COMPLICATED TEDIUS SUBJECT MADE LESS SO FOR YOUR LEARNING PLEASURE.

6502 ASSEMBLY LANGUAGE PROGRAMMING
JUDI N. FERNANDEZ, DONNA N. TABLER, RUTH ASHLEY
NOT THE BOOK BY THE SAME TITLE BY AUTHOR LANCE LEVENTHAL (WHICH IS _GOD_ FOR SUCH BOOKS IMHO), BUT A SOLID BOOK NEVER THE LESS. THIS BOOK IS SELF STYLES "A SELF TEACHING GUIDE."

THE ATARI ASSEMBLER
DON INMAN, KURT INMAN
REWARD BOOKS/RESTON PUBLISHING/PRENTICE-HALL
270 PAGES
THIS BOOK IS A DOUBLE STROKE; A 3RD PARTY'S GUIDE USING THE ATARI ASSEMBLER CARTRIDGE AND A TUTORIAL ON 6502 ASSEMBLY. I WOULD SAY LEANS THE MOST TO THE GUIDE ON THE ATARI ASSEMBLER.

THE SECOND BOOK OF MACHINE LANGUAGE
RICHARD MANSFIELD
COMPUTE BOOKS
446 PAGES
LIKE SOME OF THE OTHERS, DOES THIS ONE REALLY NEED AN EXPLANATION?

I would prefer to sell these all as a package BUT, I may wish to throw someone a bone if I feel like a particular book would be best in one person's hands even though the bulk end up with someone else.

let me know how much you are interested. What would you give me for what? What do you just have to have? Want them all (or nearly all) for the volume discount?

Let's barter. I'm not greedy but I'm not going to dump such nostalgia for pennies (not to mention boxing up, handling payment, going to post office etc.).

It is not merely a sale I am concerned with. I would like to see them end up in a "good" home. Like maybe someone who might find something key to making some software, or maybe a family who's dad (mom?) wants to nurture an interest in programming the Atari8 by his/her child.

Maybe I'm being too damn sentimental. Damn it, they seem like gold but I know they aren't anymore. Gee it's easy to get sentimental about this good ole' Atari stuff.

Jon

AC has no polarity. I do not know the specs for sure, sounds like an
Atari 800?

Sigh. Here we go... simple... if tiny fraction over an integer is
possible, and tiny fraction under an integer is possible (whatever
size that tiny fraction is doesn't matter) then size itself is also
just as possible. The answer is the integers need to be inluded in
the price table SOMEWHERE. If you don't think so, then... you are
simply... wrong. There, how does that feel? Hehee.

Regrettably I need to sell all my 8-bit Atari stuff. I will accept the highest offer received by 1 March 99. *Buyer must collect* (Blackpool, UK)

Selected highlights follow (email me direct for a complete list.) So far as I know, pretty much everything worked last time I used them.

3x2600, 800XL, 65XE, 130XE, 2x1010, XC12, 1050, XF551, 850, XEP80, 1020, 2x1027

SH204, some bare 3.5" and 5.25" FDDs, couple 5.25" HDDs, various PSUs, some other spare parts

light gun, trakball, mouse, video touch pad (for Star Raiders)

AW, AW+, AW80, DOS XL, DOS XE, Newsroom

usual collection of software and books incl. some Field Service Manuals.

lots of magazines: Atari User, New Atari User, Page 6

Please feel free to forward/repost this message to any other relevant newsgroup / mail list / web page or whatever.

Thanks

Stuart

Thanks,
I know that most (if not all) apps don't worry about the real-time date but there are still some (e.g. databases, spreadsheets) which don't use a 4 digit century and therefore get confused if they try and perform calculations, sorting etc. on user-entered data. I am interested in finding out which ones are affected.

There's history written here and there. There's some in that Levy book, Hackers, and there was quite a spread in Wired Magazine a couple of summers ago about all the people who worked at Atari and where they were as of the writing of the article. That article was intended to show that some of the most creative minds in the industry today got their start at Atari.

But the Tramiel era is, indeed, not mentioned anywhere that I can recall.

<<Hey AL!!!!

It's me, Tim... from Lansing... Remember...? C.H.A.O.S. Talked to Tom lately?
>>

Hey Tim!

Sure I remember... I'm getting old, cranky, senile, and have hairgrowing out of the ears but I remember some things and people... (grin) You know what they say.. memory is the second thing to go and damn if I can remember the first!

Visited Tom (and Lansing) a couple times last year.. I think the last time was maybe June or July. He was doing very well but unfortunately he was almost "non-Atari" as his kids had inherited most of his systems and he was playing around with PC's mostly.

What's up with you? Still an active Atari user?

Al Horton

Just as an aside, the probability of the weight being an integer number of
pounds (when *are* you going to go metric?) is exactly zero.

This doesn't, however, mean it can't happen. Consider a random number
between 0 and 1. What's the probability of you picking that particular
number? 0. But you picked it anyway.

Probabilities are *fun*.

Trying to be. Tom gave me an 130XE and 1050 drive to get me going with my PHOENIX project, but a believe my son sent some static discharge up the RF cable and fried the display chip, so I've been trying to find another Atari that would be inexpensive. I've tried a number of times to get Tom to LEND me a 256K Atari XL he has "somewhere" but it's been a no-go so far, so I've felt more like a nuisance to him than anything...

Other than that, I had dropped off the Atari scene for about five years or so... but I'm back and trying to get the web browser hammered out... Still looking for the OS listing for the Atari and as much info as I can pull together on the innards and assembly language... but all's well here in Lansing...

The Amiga joystick was made by the same "Amiga" that came out with the Amiga computer. They sold the joysticks for some quick cash when the computer was still being developed, before Amiga was sold to Commodore. Remember that the Amiga chips were intended to be in a game console at first. Turning it into a computer was the result of the videogame crash IIRC. Ahhh, I still remember the excitement when reading about the Amiga Lorraine for the first time. The 16 bit sprites that the hardware put out it vertical stripes of memory like player/missle graphics on the Atari were what sold me. It was a Jay Miner design all the way.

It is esentially a 2600 in a smaller package (the controllers even hook
up to the adapter, not the host system) which obtained power from the
5200 cart port and output audio and video through the cart port. I
recommend you just get a 2600 jr which is about as small... ;-)

>disks would work at all.

I still kick myself for getting rid of the huge amount of software
I had for my old 1200XL. I don't lament getting rid of the hardware,
as I've been able to recover all of it cheaply, but man, some of that
software -- disks and cartridges -- are quite hard to find now even
in ATR format, much less an original with documentation.

About three years ago, I reacquired an 800 system with a bunch of
other stuff (about 40 original software titles, a 1050 hard drive,
1025 printer, lots of original system documentation) for $100 from
a local seller who kept it all in impeccable condition. Since then,
it's been a matter of finding what I can, where I can -- a guy in
Alaska was nice enough to *give* me an 850 interface (he had several
of 'em) for only the cost of shipping (and he even shipped before
he received my check); I bought a bunch of stuff from American
Technavision when they were blowing out their stuff (extra 1050
drive mechanisms, SIO cables for $1 each in bulk, lots of disk and
cartridge software for $2-3 each); finding 5 joysticks, a 1027
printer with ink rollers, several power supplies and 1030 plotter
for a total of $20 at a local junk electronics store.

But some of that software, man, I just can't find. Plus I miss
the 1200XL's feel. Great keyboard, man. :)

I used to get a few things through eBay as well, but it's become
a less fertile hunting ground as it's harder for buyers to
snap up bargains these days without being suddenly outbid two
minutes before the auction ends. I haven't been a successful
bidder for any Atari stuff in months.

In any event, welcome back -- another lost sheep has returned
to the herd!

Haven't found a cheap MIO or Black Box anywhere, but I'm still
looking. :)

Truth is, in my book, a Mac or PC emulating a Atari BECOMES an Atari. It
is like George of the Jungle's elephant shep that thought it was a dog, and
being a rather large creature that thought this, no one was going to argue
with it. :)
"That my big grey peanut loving doggie Shep!" -George

The same could be said for a modern powerful computer that thinks it is
a 1.77 mghz Atari. ;) Just slap an Atari fuji over thst Apple icon and you
have a less elegant Atari.
Still have fun with the real thing, but "Sheps" have a place here
too. :)

Now you're no fun. :) But seriously, speaking of arcade emulators
versus the 8-bit version, I have to say I prefer the Atari 8-bit version
of JOUST over the arcade version.

Mathy,

You may want to consider an external hard drive case, they are plentiful, attractive and cheap, search the web and I'm sure you'll find someplace. I see them a lot in surplus electronics magazines that liquidate large quanities of products. You could modify the front to pass the connector through and since it has a built in power supply and mounting rack you can mount your floppy drive inside of it, then modify the internal cable-to-external connectors on the rear, buy a 2nd case, mount your hard drives inside of that and connect them together. It will be attractive and functional.

The IB Clock cart also is not Y2K Compliant, I tried it out with an old copy of
BBS software and it freezes completely and halts the Amis BBS software.

Yes Larry,

If not for the Tramiels, we may all be using Atari 1450XLD's, Atari 1650XLD's (MS-DOS Clones) and Atari 1850XL's (Atari version of the Amiga Chipset). Commodore would have folded back in 1985-86 since it had nothing to compete with. The Atari 7800 would have been released in 1984 instead of late 1986, the Advanced Game console (a 16-bit game console in 1985 based on the Amiga Chipset) would have been released. We would have Atari 1090XL's and dozens upon dozens of expansion cards to choose from. But the Tramiels fixed all of that. (being sarcastic, sorry...)

Just from an adminstrative point of view then, they should get rid of
the emulator newsgroup. Doesn't matter to me.

You are always wrong to post to a 'less correct' newsgroup though. For
instance, if this newsgroup was further broken down into things like
[.8bit.hardware, .8bit.advocacy, .8bit.games, .8bit.programming] then
posting hardware questions to the .advocacy group would be a mistake.

Kind of a hold over from when disk space was at a premium 10 years or so
ago. Wasn't uncommon for 120 meg systems to be used for everything from
email to newsgroups. I have heard the rumor that someone was actually
running a Waffle board with a few newsgroups on a 30 meg system, but I
still find that a little hard to believe.

: It's fun to split hairs... sometimes.

We could get even more tedious by suggesting that this whole business
should be referred to a mathematician who is familiar with concepts of
"infinity". Strangely enough, there's more than one kind of infinity;
some are bigger than others (infinitely bigger, of course). The smallest
one, which represent the total number of possible integer weights,
whether in grams, pounds, ounces, or whatever, is called Aleph-0 .. it's
the smallest infinity. A much larger one represents the total range of
weights, integer or not .. that's a bigger infinity (much much much much
much larger than aleph-0). Dividing aleph-0 by the larger infinity, you
get zero chance of exact weight. Don't take my word for it .. ask you
local math professor.

Meanwhile, if you insert a word such as "practially" or "virtually"
before the word "exact", most everyone would agree with you. It starts
to sound like the ancient joke of an engineer with a slide rule: "Two
times two is three point nine nine nine ... call it four".

I know, don't add to the thread that ate Cleveland, but... I really want to!

David Given wrote:
> Just as an aside, the probability of the weight being an integer number of

>
> This doesn't, however, mean it can't happen. Consider a random number
> between 0 and 1. What's the probability of you picking that particular
> number? 0. But you picked it anyway.

Ah, but zero probability means that it can't happen. And there's no contradiction there, because David's example involves picking a number with infinite precision. The probability of picking any number with infinite precision is 0, which proves the central point that you can't have infinite precision. Just try it- write down a number with infinite precision, and I'll ask you what the next digit is.

Now I know some people are going to say, "So that proves that you can't have an exact integer weight." But the fact that you can't have infinite precision means that you can't know which side of the integer the actual weight is on, when your scale (however precise it is) reads an exact integer. So to be practical, you have to assume it is the exact integer. After all, any reading on the scale actually refers to a range of + or - half the precision (say +/- .005 for a scale with two decimal places.)

-- All of which proves that 1.) Be careful what you say, because if you make a simple error, you never know what you might start, and 2.) He who starts a thread has absolutely no control over it afterward. :)

well. I guess I have to reply to this, don't I?
My plan is to run the memory (using SRAM, not SIMMs) at 14mhz. Replace the 6502 with a 65816, since I have no source for 20mhz 6502s. All other CPU accesses will be at 1.79mhz (to POKEY, ANTIC, etc.). Basically, at the start of every CPU address cycle, the logic will determine if this is an SRAM access or something else. If it is SRAM, it will clock at 14mhz (70ns.). If it is anything else, it will sync to the 1.79mhz clock just like the old 6502 and run a full cyle. When ANTIC wants the buss for his memory access, he gets it just like normal, halting the 65816. If you pull the OS ROM into SRAM and turn off ANTIC, this would run really, really fast and still be compatible with normal Atari protocols.

As an alternate, you could run an auxillary CPU that can access the Atari RAM as well as its own memory. This would have the advantage of not being slaved to the Atari interrupts nor halted by the Atari display chips. A 14mhz, 512K processor in such a configuration could be interfaced to any modem, for example, and run 115kb (heck, a 32K 1.79mhz processor could do that...). So, you set up your math operation for the FP ROM just like normal but then call the aux processor to do the math. He does it about 12 times faster than the 6502 and posts the result in the FP regs - all using the same FP code and routines. Sure would pump up all BASIC programs, wouldn't it? Or, you have some really big array to process - shove it into the aux memory and set him loose on it. Done in no time.

Bob

Boy I didn't realize you guy's are so negative about ebay. I received email from someone else asking the same question. Well, the answer is "NO! I don't want to sell this book on eBay!"

I'm selling my Commodore books on ebay to get rid of them quickly. I did sell one batch of books for the Atari because they were duplicates of ones I already had (Mapping the Atari, Atari Sound & Graphics, and Atari Graphics and Arcade Game Design). The books I just posted in this newsgroup really are not for Atari's either. The assembly language book is really "Commie-centric."

I have picked up several Commodore machines and books from friends and from a great 2nd hand store near my home, but after my wife and I had our first child we have had to get rid of some things around the house. I just decided to sell the stuff off quickly on ebay. But, I would never part with the Atari books I have... I already made that mistake once several years back after my Mom took donated my 800 system to the local Goodwill (I don't blame her though, I just left it in my closet and forgot about it... until I saw my first emulator). I guess I'm just trying to re-live some of the excitement of my first computer. I'm learning 6502 assembly language for the first time too (De Re Atari is simply excellent). Also, I'm mostly code in Visual Basic at work, so I thought it would be really interesting to check out how Atari BASIC is implemented while I'm learning 6502 (lots of good examples I hope). If you do have a copy you would part with, or know where I could get one, I would really appreciate it.

Here's a little more info about me, along with a link to a page of pictures of my new daughter...

http://members.ebay.com/aboutme/danver@halcyon.com/

I hope I'm back in everyone's good graces??

Thanks,
Dan Vernon

> Dan, is that why you want to buy Atari books from us so you can try
> and sell them on ebay? I was looking for a good home for my books.
> Hell, I can sell them on ebay myself. Hmm.

(For those who don't know what this is about, Jon is accusing me of wanting to buy his Atari book for the purpose of selling it again on ebay. While this would be legal in a strict sense of the word, it would not be fitting behavior for an avid Atari fan and respectable member of the comp.sys.atari.8bit community because Jon wants the books to go to a good home.)

It's too bad that I am guilty until proven innocent in this accusation, but unfortunately that's the way it is here. So in an effort to clear my name I will offer the following two proofs of my innocence.

1. I am an Atari nut.
I bought my first Atari 800 in 1980 from money earned weeding shopping centers. It took months and I spent these months drooling over them in the display cases around town. Finally my parents helped me with the last few hundred dollars. But I did manage to earn close to $600 (at only twelve years of age) in order to buy the machine. These days, I have a 1200XL, upgraded with Steve Tucker's AWESOME Warp 4-in-one OS, and I am a registered user of APE. At work I have an 800XL sitting beside me that is on the corporate, nationwide LAN - I can access NT servers with this one. I have bought most of the Atari books I own, (which I never intend to auction, except for maybe any duplicates) from Ben Smith, the gracious proprietor of Bravo Sierra Computers. If this doesn't make me an Atari nut, then what does? Please contact Steve or Ben to verify any of these facts.

2. I already tried to buy this book, "The Atari BASIC Source Book" on ebay only a few days ago for quite a sizeable sum. Check this link for proof:
http://cgi3.ebay.com/aw-cgi/eBayISAPI.dll?ViewBids&item=53973341

Now why would I do such things if I just wanted to sell the book again?

I hope my name is cleared from any accusations now. While I understand what Jon is concerned and has posted what he did, I think it's a little premature to pronounce judgement, and carry out execution before the entire world before giving me a chance to defend myself. Is it wrong to sell things and want to buy other things? I think not.

Thank you for hearing me out,
Dan Vernon

of
>BBS software and it freezes completely and halts the Amis BBS software.

Could you tell us more about the IB Clock Cart?

With the RT8 you get the wrong day because the old TDLINE wasn't Y2K complient. This is changed in the new version that came with Sparta 3.2g. Now you have no problems untill 2083. Which makes me believe it uses some kind of reference date. Maybe somebody could rewrite the handler so that the reference date would each year be changed to the day it was changed. That way the reference date keeps moving ahead in time.

Hello. Please allow me to further elaborate on this post. Follow closely
boys and girls.

If you go to the post office and mail a package that, according to the scale
in use at the post office, weighs 2.0 pounds or less, you will have to pay
$3.20.

If the package, according to the scale in use at the post office, weighs
more than 2.0 pounds, but less than 3.0 pounds, you will have to pay $4.30.

If the package, according to the scale in use at the post office, weighs
more than 3.0 pounds, but less than 4.0 pounds, you will have to pay $5.40.

If the package, according to the scale in use at the post office, weighs
more than 4.0 pounds, but less than 5.0 pounds, you will have to pay $6.50.

If the package, according to the scale in use at the post office, weighs
more than 5.0 pounds, but less than 6.0 pounds, you will have to pay $6.60.

Add a dime for each pound, as measured by the scale at the post office, up
to $7.00 for a package, now remember, according to the scale in use at the
post office, weighing more than 9.0 pounds, but less than 10.0 pounds.

Thank you for allowing me to clear that up.

Sincerely,
Jason Whorton

>
> Curt
>

Sarcasm aside, what would have happened if Jack Tramiel hadn't taken
over Atari?

Do you think they would have got their act together and flourished, or
gone the
same way as TI's home computer division and been axed completely? What
would you
have done if you had been in charge of Atari back in 1983? (open
question to
everyone on the newsgroup)

For myself, I would have scrapped the 5200, gone ahead with the 2600jr
and 7800,
released the 600XL in a starter pack, released the 800XL, reconfigured
the
1400XL to have 256K RAM and 80-column display but dropped the speech and
modem,
and scrapped the 1450XLD in favour of a keyboard-detached design with
the
expansion cards and dual disk drives housed in the same unit. (Expansion
cards
would also have been usable with the 1090 unit on the other XL
machines). The
1050 would have been released in true double-density form only.

Dunno if any of that would have helped though, which brings me to
another point:

Did Atari's computer division EVER make any money? - I had assumed that
Atari's

computer division had made money from 1979 - 1982, but looking at the articles
on Curt Vendel's site (Thanks Curt, cool site!), it would seem that even in 1981
they were losing money, and by 1983 Warner had had enough.

I saw an interesting TV show a few months back on the subject of management. The
speaker claimed that in 1981 Atari hired something like half of the top graduates
from Harvard's MBA program, and within two years Atari were nearly bankrupt!

Oh well, back to work.

There's a notation for doing just that; I can't do it in ASCII but it's
putting a double-dot above the last digit of a number. So 2.0-double-dot
means 2.000000... to infinite precision.

Just because it's an infinite-precision number doesn't mean that it can't
be manipulated. (If it comes to that, all fractions are
infinite-precision.) My example still holds.

>Now I know some people are going to say, "So that proves that you can't
>have an exact integer weight." But the fact that you can't have

Okay, physical quantities are different. But just because something can't
happen in the real world has never stopped a mathematician yet...

>Probabilities are *fun*.

Still wrong. I don't know what language you speak, but to me, when
someone says that the probability for something to happen is "zero",
that means there is NO CHANCE of it happening. That of course is
inconsistent with a quote from your very next paragraph of "This
doesn't, however, mean it can't happen."

I submit to you that no matter what scale or resolution of measurement
you use, any one PARTICULAR integer value is EQUALLY possible as any
one PARTICULAR fractional portion (so long as fractional portions are
using same resolution and scale). Nauturally, if you compare
probabilities of a result being ANY of the measurable fractional
values as opposed to the chances of the result being one of the fewer
integer values, there are more possible fractional values so the odds
are higher.

The probability of getting an interger result is more than zero
however.

na na na, nuh nahhh na.

;-)

Hey, thats kewl. Just napped another machine. All for FREE. 130XE , 1050
drive and a 1027 printer. with docs and two joysticks (OEM) and a few games.
Millipead, Caverns of Mars and Atari Writer. In cart form. and Flight Sim 2
all original docs and disk and it all works.
Talk about being lucky.

You didn't clear it up silly. You just restated the original
information (logically speaking). You still do not account for a
weight of say 4 pounds for example. It needs to be written like this:

w<=2 $3.20
2<w<=3 $4.30
3<w<=4 $5.40

etc.

Where w is the weight in pounds, < means item to left of it is smaller
than item on right, and <= means item to left is smaller or equal to
item on right.

Is that clear enough for ya? Or do I need to write out the logical
equivilent in long vebose text? Can we be any farther off topic?

Can we eat peanutbutter in 20 below 0 F?

I don't know.

Okay all... I regret to inform you that my book collection can be considered sold. I truly am sorry to disappoint anyone who was hoping to nab something they have been wishing for. I wish we all had every Atari8 related book we ever wanted available on CD or something and no one was wanting for anything. But alas... mine are being sold to a certain party so no more inqueries about those.

Thanks for your interest and good luck on getting what you are looking for.

I agree on the 80 columns and the detached keyboard, but I wouldn't have
scrapped the speech. The modem could have been one of those expansion
cards.

(Expansion
> cards
> would also have been usable with the 1090 unit on the other XL
> machines). The
> 1050 would have been released in true double-density form only.

Yep, and some effort would have been made to standardize DSDD, too.

> bankrupt!

Maybe Atari wasn't making money for Warner, but it doesn't take a genious to know that if a former textile executive can't run his division at a profit, and you want it to run at a profit, you go out and get a computer person. It also goes back to the lack of focus and real effort in marketing, something that all Atari managements exhibited. Sure, Apple was first into the schools. For my own personal prejudices, I would have pushed the education market hard. Atari 8-bits certainly had superiority over the Apple][re: sound and graphics -- two badly needed capabilities in the educational software of that era. I'd be sure to have some wizz-bang courseware available before the effort started. It would be original, written in consultation with a real school district, and not just a port of something that had already been done on the Apple. Apple made two-for-one offers for hardware? I'd meet or exceed that, if I had to! And if top Warner management said they couldn't spend the money, I'd show them what Apple was earning in the schools and how easily Apple could be surpassed in that area.

Looking back, I think the guys at Atari throughout the early 80's blindfolded themselves and then threw darts at a bulletin board that had slips of paper containing words like "business," "education," "gaming," etc. Wherever the dart landed would be the focus of marketing effort for that week and that week only.

Now, having demonstrated an ability to make money in one market, say, education, I would then have pushed into another. And the market chosen would be a major one, not a small niche like animation or music (there I go, offending large segments of society that I really admire again!)

> Oh well, back to work.

Are you sure you want to do that?:)

606. Re: ICD MIO specs

(Somebody wants power specs for MIO.)
Somebody else (? I forget), says 9vac 3amp or so.
Right.
BUT, my 1 meg MIO takes a 9.3v 1.95amp DC.
Now. usually you don't want to get the power requirement wrong.
I think somebody said you could use AC or DC on a MIO. BUT,
I wouldn't try it.
So, which do you have? I don't know. Sorry, not much help
accept to say I'd hate to fry my 1 meg MIO with a 9vdc
or my 256k MIO with a 9.3v DC.
Russ

Hi MIO owners,

I have a working ICD Multi I/O with 1 meg. I bought it used many
years ago. The power supply that came with it is a....
DataByte
Model NO. DV-9034A
Input: 120V AC 60HZ 42W
Output: 9V AC 3.4 AMP

This power supply is many years old, but still works great, so does
the MIO. A few years back I fixed a friends 256K MIO. And I'm
almost positive that I used my power supply with it. Which didn't
cause any problems.

Not sure if this is the original power supply. But I have not had
any problems at all with it.

Hope this helps,
phantomm@kih.net

I couldn't agree more... the 'suits' at Warner killed the division.. Not so
much 'garmento' thinking, but suits... the bottom dollar means more than
creativity... they were, even today are, more concerned over profitibility
versus product... they should have chased the schools.. instead, they pulled
their pants down to sell quantity.. at every discounter... starting with
ToysR'us... you can't..mark my words.. you can't survive long selling
discounters...You should only know the carnage WalMart's left behind...
B'rgds,
Vinnie

The RT8 comes up frequently. I have one,
and after the first battery went, I was never
able to get it working properly again.

Did anyone ever create a "clone" of the RT8?
As I recall, Best Electronics was working on
this at one time. (?)

There is a clock chip made by Dallas Semiconductor (I think) that is used in some
computer items. Has anyone ever experimented with it to make a new clock
cartridge?

The bad news is the XEP80 doesn't work well with the JAM!!
The good news is that 80 column (software) looks very good
on the JAM!! Still *slightly* fuzzy, but very, very good, and
probably with a little work on the fonts/colors, it could be great.
I was looking at a 80 column demo on an OHAUG library
disk today, and it really was very impressive. Score another
one for the JAM!!

>DC), amperage and/or wattage is for the MIO power supply.

The power supply is 9vac, 31va (about 3.5 amps). Basically, the same supply
that powers the Atari drives and the original 400 and 800.

hey bob what do you think of using a 65ce02 to speed up the atari xl/xe? i
know it wouldnt speed it up greatly but would be pretty nice bump up.... i
knew of a place i could get them a few years back but i am not sure now tho'
i put one in a 800 and had to change the os rom a little (because of the
timing...)

The problem is, you go back to the old issue of the Antic being tied directly to the processor
and the GTIA has to sync with the Antic, so you can touch one without effecting the others. Whats needed is someone in chip design who is an avid Atari person looking for a challenge, that being a ground up enhancement of the 8-bit line while attempting to maintain backward compatibility. Commodore was toying around with the C-65 which had some very impressive screen resolutions. I think first what is needed is to see the JAM!! technology come down in price and reduced to a small component count, then it could be added as a daughter card to
any Atari 8-bit, now that coupled with a lot of the 80 column software out there gives the 8-bits crisp VGA 80 column resolution, thats a start albeit a simple one.

It would simply be a manner of fixing the Z: handler since programmes don't
access the cartridge directly.

Source record: 56099

Here's a new one. I ran across this
item on ebay, and it said that no
power supply was needed with the
XC12 - that it was powered by the
computer. True? I've can't recall
an A8 (active) peripheral that didn't
have its own PS.
Larry

634. 7800 vs. A8

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-17 00:00:00 UTC
From: lwhite6497@aol.com
Message-ID: <19990117063341.20877.00002687@ng41.aol.com>
Source record: 56100

Two questions:
In general, were the graphics on 7800
games better than the A8 (higher resolution,
more colors, etc.)
And did they use regular (A8-type)
joysticks?
Larry

> >newsreader that will do what I want the way I want it. VIM handles the
> >job quite well. What can I say?
>
> What's wrong with trn then? :-)

Probably nothing. I don't know much about it, but from what I have seen of most newsreaders the biggest drawback is size. I seriously doubt that it will fit on a floppy with all my other goodies and still have enough room left over for my gzipped newsgroups.

Secondly, most newsreaders download each article as a separate file. I prefer to download the whole group as one file. Tin peppers everything with little files. I don't know if trn does that or not.

Thirdly, the newsreaders that seem to be able to do what I want have such complicated commands, so that limits the usefulness of it. I know that sounds strange coming from a VIM user, but that's the way it is. With VIM, I can make up my own commands and macros as I go. If there is something else I want it to do, I just modify a macro or make a new one.

Now, Pine does almost everything I want, except five very critical things:

It is difficult to use it as an offline reader/composer.
It won't fit on my floppy.
Even though it allows custom headers, some things I can't configure.
It won't allow me to easily add or modify features.
It can't flag or stop the download of oversized articles.

Since I run off a floppy, I consider anything over 10kB to be oversized. If the subject matter is good enough, though, I will download it. VIM gives me that option, plus almost any other option I decide to add whenever the whim hits me. :-)

The P: R: Connection(ICD/FTe) and the MidiMax Midi Interface (WizzTronics) as well as a number of other interfaces (RVertors, many printer interfaces, SIO2PC devices) take power from the computer. Agreed, not all of them are active components and none were made by Atari, but if you stop to think, there are many. A motorized device like the CX12 would surprise me, but like Dean said, it does take power from the computer.

Actually Larry,

There were several: The Atari XM301 Modem, the ICD PR: Connection
and the XC11 are all SIO powered devices and will work with almost all
Atari 8-bit computers (the Atari 1200XL requires a minor SIO upgrade to
restore the 12v+ line which for whatever odd reason was omitted from the
design.

639. Atari joystick on modern PC?

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-17 00:00:00 UTC
From: eegad@rocketmail.com
Message-ID: <77t64clp3@earth.superlink.net>
Source record: 56105

Anybody know of an adapter that would allow me to connect a plain old Atari joystick to a PC? (in case you're wondering, I'd prefer to use a standard old atari stick to play pacman, galaxian, etc with MAME). I know such a thing exists for the Mac (I've got one), but is there a similar device for the PC side?

640. Re: 7800 vs. A8

Newsgroup: comp.sys.atari.8bit

Larry,

Yes, the Marie chip could produce a full 320X200, and I believe a higher resolution of 320X216 (I'm not quite certain I'd have to pull the spec sheet out). Also it could handle up to 100 independant sprites and had some additional features that the Antic/GTIA did not have.

Radio Shack has these little deals that hold two AA batteries and have
them connected in series to a connector on the end of the holder. The
connector is the same type that 9V batteries come with. The also have
the mate to that type of connector with two electrical leads coming
off of it (which you run into the RTIME and solder to the board).

Of course it does nothing about Y2K but then you knew that. :)

Hi Arthur !

You can try the my Atari-to-PC Joystick interface. You can find all the
information at the URL :
http://gauss.math.ucl.ac.be/~manu/Atari/joystick.html

If it is difficult for you to build such a device, I can build for you. If
you use it, I will appreciate any kind of feed-back.

Have fun!

Emmanuel.

Good point about the 400/800. I tried an XC12 with a 400 and as soon as the motor starts, the 400 dies! Not permanently, but I found that if you press play first, then boot the 400 to load the tape, the 400 stops. If you boot the computer first, then press play it works OK.

Since we are on the topic of cassette recorders. I have two 410s and
it seems that they can't rewind/play/advance a tape very well. I can
hear the motor coming and the spindles are try to turn.

Can anyone reccomend a solution to repairing these items.

Thanks

> Black-Box / D9: / ROM-version / CPS
First: the D9: feature... I don't mean a Sub-D-connection or whatever.
With the "D9:" I mean the Black-Box does not only handle diskdrives
(partitions) from D1: to D8:, but in the "newer" ROM-versions one is able
to also enable "D9:".
This means a max. of 9 times 16Mb when using a DOS which supports it, like
Sparta- or My-Dos. With a Ramdisk, you "only" have 8 times 16Mb of
course...

The hardware-handshake: I'm not using Len Spencer's handler, but when
using BobTerm 1.23, null-modeming to my Pentium, and turning OFF antic, I
get a transfer-speed about 1890 CPS when uploading a file to the PC from
the Atari ramdisk to HyperTerm (Win'95)...
I use a 5-wire null-modem, Y-modem Batch, with BB-Rom 2.16...

Ok, I'm up to the task. My number is 1/3

>
>When I say any real number, I mean *any* real number. The probability will
>be exactly zero. Zero-probability events are a well-known phenonemon in
>the mathematical world.

That is incorrect. With infinite precision, the precise probability
would be 1/infinity which is ALWAYS greater than zero. It is a
special case, but it is logically always greater than zero. Besides,
that is not what the question at hand was. The whole thing started
when integers were omitted from a shipping weight price scale. I
simply pointed it out, that an integer weight is JUST AS POSSIBLE as a
fractional weight. You must understand, that the measurement
resolution is not infinite. It does not matter what that resolution
is either, so long as it is not infinite. For example, is the scale's
resolution were in say... milligrams, 999mg, 1000mg (or 1g), and
1001mg all have an equal probability relative to each other of being
what something small weighs. Obviously, grams or milligrams are a bit
unrealistic for mailing packages but the same principal applies to
other units. Now then, that being said IF the resolution of
measurement is at least finer than half of unit, THEN the probability
of a weight being any of the fractional measures is greater than it
being any of the integer measures; because the fractional graduations
outnumber the integer ones. Still, integers ARE possible. Also, if
you compare the probability of any ONE fractional outcome to any ONE
integer outcome, the odds are EQUAL! In other words, if you have a
scale in pounds that has a resolution down to 16ths of a pound, a
result is just as likely to be 2lbs as it is to be 2 1/16 lbs, or 1
15/16 lbs. Each graduation on the scale is equal in possibility as the
other markings, be they fractional or integer. Get it? Why is this
SOOOOO hard?

>
>>So the example does not hold. And it should not, since it violates the

>>definition of zero probability. (An event which has zero probability is
>>impossible.)
>
>Only under some circumstances.

No, every time. Zero is none, nada, zilch. 1 over infinity is not
equivalent to zero. It is a special case and uses the 1 over the
little number eight on its side symbol of infinity and is always
greater than zero, but yet infinitely close to it.

Anyway, that's getting way outside the scope of the original problem.

I'm writing an article for an on-line publication about technological breakthroughs in video/PC gaming. I'm going to include breakthroughs that were successes and flops. I'm looking for as much input as possible so I can be as accurate as possible. If you know a game, game system, computer accessory, etc. that you think is worthy of this topic, please write me at hughfalk@mindspring.com.

Examples:

The first PC game to network 2 PCs.
The first game that allowed two players to play via a split screen.
The first game to use parallax scrolling.
The first light gun.
Etc....

Hmmm... I remember the arguments we got in over which was better (OK, so I was 14 at the time). Seems kinda silly now, but the one thing C64 and Atari owners could agree on is how much the Apple II stank ;) Considering all three used the same family (model?) of CPU, its amazing how different they all were.

The thing that really bothered me about the C64 was that pig-slow disk drive! Loading Seven Cities of Gold --- AAARGGH! I thought for sure there was a cassette drive hidden in there. The SID chip is very nice, and the sprite handling was better than Player/Missile graphics, IMHO.

Atari had one feature that rocked, and that was the 4 joystick ports... MULE anyone? JT was crazy to get rid of them. And POKEY wasn't the best, but it had a real ARCADE pedigree, so we Atarians felt a little uppity about that :)

I love both machines now, and love talking about them. Still not crazy about those Apple IIs, though..... ;)

Cheers,
Steve

They can use those joysticks, but some games are not quite the same with them. Xeviuos needs two firebuttons for more control. One for shooting and one for bombing. Using a standard Atari stick does both at the same. Basketbrawl too uses two buttons and I guess a lot more.

The graphics are better. It can use more colors in higher resolution than the Atari 8-bit computer and also has a lot more sprites (player/missiles)

> Okay, physical quantities are different. But just because something can't
> happen in the real world has never stopped a mathematician yet...
>
Let me clarify my statements; I didn't mean that infinite-precision
numbers couldn't be manipulated, I meant that they couldn't exist in the
real world. I'm familar with the "repeat the last digit ad-infinitum"
notation, except I learned it as a bar above the last digit, like this:

_
2.00 means 2.000000000000000... (display with a non-proportional
font.)

_ _
and 1/3 = 0.333 = 0.3 ...

I guess you put the double-dot horizontally where the bar is. (So
that's good, I learned something.) But that's mathematics. It's like
the geometric definition of a line: nothing in reality can be in the
form of a line; it's an abstract concept. But you can manipulate lines,
and you can draw representations of lines on paper, or on your classic
PC. :) Anyway, that's what I meant, that you can never know any
real-world quantity to infinite precision. I assumed you were talking
about real-world quantities as well, since 1.) we are talking about the
weight of a package (if you search back far enough in the thread,) and
2.) you wrote, "This doesn't, however, mean it can't happen." I thought
"happen" meant in the real world.

The problem with your example is that you are combining real world and abstract concepts. You are presuming the number I picked has infinite precision in order to arrive at 0 probability, and then you are saying, "but it happened" that I picked the number in the real (finite precision) world. If I choose, say, 1/3, that doesn't count as "but it happened," because it didn't *really* happen, since it doesn't correspond exactly to any real-world value. "Pick" implies from a real-world set, and no real-workld set has infinitely many elements. And if it doesn't have infinitely many elements, the probability of picking any one element is not zero.

So the example does not hold. And it should not, since it violates the definition of zero probability. (An event which has zero probability is impossible.)

Anyway, the thing with the water and the bridge.

Stephen

I'm a C64 owner, but I used to get annoyed when Julian Rignall (a reviewer from Zzap!64 magazine) raved about the 800XL and how it was better than the 64. Also, I recall Archer Maclean saying that Dropzone (one of the all-time greats) was about 50% faster on the 800XL than on the 64 due to the limitations of the 64.

When I bought a computer back in 1984, though, I had to choose between an 800XL and a 64 (when both were fairly new in the shops), and I'm very glad that I chose a 64. Virtually nobody bought 800XL's in the UK.

Howdy folks

I recently looked at the schematics for the 1050 and the XF551. (I wanted to add a power on light to my XF. It's easy. Just replace the power cable going from the motherboard of the XF to the drive mechanism with a cable they use on PC to power the display in the tower/case. Solder a 180 Ohm resistor to a LED and connect this to the cable I just mentioned. Sorry, I don't remember with pin of the LED goes into +5V and which goes into ground. Be carefull is you want to drill a hole. I used a thingy to place the LED in. Maybe it's better to loose that and glue the LED into the hole.)

Back to business.

So I compared the power stuff inside the XF and 1050 (you know, the rectifier and the stuff that surrounds it). They look about the same.

SO WHY DOES THE XF551 GET SO DAMB HOT, when the 1050 doesn't???

CU Mathy van Nisselroy

PS resently somebody said somewhere that Commodore stuff broke down even faster than Atari stuff. Well, guess who founded Commodore?

Howdy folks

lwhite6497@aol.com says...

>Did anyone ever create a "clone" of the RT8?
>As I recall, Best Electronics was working on
>this at one time. (?)

Brad himself told me (and some other people who wanted to know) that he had some people from the UK working on it. There were some problems. Then Mike Hohman bought ICD's rights and all "clones" including the one Bob Puff planned were gone forever. I've heard from a reliable source in the Atari community, that the manufacturer of the timer-chip in the RT8 MIGHT (MIGHT as in NOT sure, MAYBE, etc.) fire up the old production line of these chips for a big customer. Who knows?

If I'm not mistaken (I don't own one of these carts) the RT(consists of a M2002 (or EM2002 or something like that) and a 74LS138.

>Tobias

It was an Eastern European site. Don't know where anymore. SixOSix replied to
a message posted here by me in late OCTOBER 1998. I've found a solution.
It's called DISKF090 of DISKFORM by Ken Siders. Runs on atari 8 bit computers
and can change ATR's XFD's and real disks into ATR's, XFD's and real disks.
YOu can use the with SIO2PC or APE or WITHOUT!!!!!

GREAT utility.

>magrep@northnottsmag.freeserve.co.uk

If you have a 130XE and it works, you don't need to buy the CO25953. It's
already inside the 130XE (on the left side, just above the big chip in the left
hand corner).

If you've blown it, try Best Electronics in SAn Jose, California, USA. There
was somethig like The Alameda in that address too.
They sell them for 10 US dollars (no discount on quantities)

Or try B&C computervision. They sell them for 12 US Dollar.

CU Mathy van Nisselroy

PS you need only a 74LS158 and 8 RAMchips (256kB).

Source record: 56129

Hello Freax,
I am maybe completely foolish, but yes, I use my Atari XL and XE every day. At least two hours per day. It is my most beloved hobby, although I am a student and have to do other things as well (earning money to pay studying, learning, etc.). The only thing my PC 486 is good for, is writing long texts, that would be very hard on time, if they were written on the little Atari computers. Of course there are some good text editors for the 8Bit, calculation programs, etc., but mostly you have to do some disk swapping (I do not own a harddisk, thus never use Sparta-DOS), before you get the things you want. Thus I mostly use the 8bit for gaming around, converting PC texts, PC pictures, PC sounds, etc. Also I am transferring Atari files from the PC (Internet, ABBUC Pooldisks CD-ROMs, etc.). And hey, the 8Bit has some uncountable (thousand) games avaiable, how many has the playstation?? It has better graphics you say ?? Ok, then use the Jaguar...

I love the 8Bit, I still use it every day. Most friends of mine cannot understand that, but that doesn`t matter at all. The only thing I hate very much is using Pirate software on or from the 8Bit. In recent years nearly everyone said "The software costs to much money, I cannot afford that" and copied it illegally. Nowadays these people say "The software is not avaiable anymore nor anywhere, thus I have to copy it, to keep it alive." I do not agree to any of these thoughts. Software pirating is just cheap, does not cost any time or money, thats all. If you would spend the money or time needed to search and buy the software, you could nearly have 70% of all the software ever produced for the 8Bit Atari. Just look around at those Atari dealers, Internet auctions, etc. You can find everything here (if you can afford it). But stealing software has ever been so funny, so cheap, so comfortable...

Where would the entire emulator-scene be, without those copies ?? Oh, I forgot to say: I hate Emulators !! They are damn boring, when you can use the original Atari equipment. If you do not have one, buy one, there are many out there, just look at the comp.sys.atari "for sale" announcements... Andreas Magenheimer

Hello Zaxxon Freax,
the Games Zaxxon and Super Zaxxon were avaiable on Diskette. Here in Europe they were sold under the US Gold label. I also own one Zaxxon disk, sold by Datasoft, but I do not know if they sold Super Zaxxon too. If you want to know whether Zaxxon is/was avaiable on cart., take a look at the big cartridge list from Andrew Krieg (do not know the URL by now). If you like to get the original disks, well, they are still avaiable (call BEST Electronics, Bravo Sierra Computers, B & C Computervisions and in the UK: Micro-Discount, Page 6/N.A.U., etc.).

Well, Dropzone is better on the Atari. The colours for one and the explosion is amazing. Also Rescue on Fractalus is faster and more playable. M.U.L.E. was pretty close on both, but the Atari version of the space ship dropping you off and the pirate ship were better. But I do remember many UK games especially that were really crap on the Atari and good on the C64. I do think the Atari has a little more speed to boost. I coded some demos on the Atari and still haven't seen any on the C64 which uses the machine. My friend is totally awestruck by the C64 sound, but the colours on the Atari is a big plus.

>real-world set, and no real-workld set has infinitely many elements.
>And if it doesn't have infinitely many elements, the probability of
>picking any one element is not zero.

?

I never mentioned the real world. I could rephrase:

Pick any real number from the bounds (0, 1) and calculate the probability
of that number being picked.

When I say any real number, I mean *any* real number. The probability will
be exactly zero. Zero-probability events are a well-known phenonemon in
the mathematical world.

>So the example does not hold. And it should not, since it violates the
>definition of zero probability. (An event which has zero probability is
>impossible.)

Only under some circumstances.

The subject has stopped breathing. I think it's dead...

Hm, I'm a C64 coder, and I think if you take a look at Turrican and at
some Demos like Spasmolytic/Censor or the latest CREST and Oxyron Demos,
you'll see a lot of machine usage.
What do you mean my "using the machine" ?

Some Wild VIC effects, like Sprite multiplexing, Blittering and border-
opening are definately use of machine in my eyes.

I haven't seen a demo using the borders, with lots of other stuff going on,
but I did see some using the effects good. I like to see it all in one
demo. That's what I mean. If they do indeed play music, use borders, multi
sprite effects and lots of colours (not interlaced and flickering like
hell) and some scroll texts waving around in sinus curves, that's what I
like to see. I do like the C64 more now than I did then, but I still keep
the edge on the Atari.

Yes, I have and use both.

There are two things that are pretty annoying on the Atari:
1) Lack of software when compared to the C64
2) Many software titles that look like VCS stuff.

Overall, C64 programmers use the capacities of their computer a lot better.
There are some amazing games on the Commodore (Mayhem in Monsterland, Nobby the
Aardvark, Creatures 2...) and, until someone proves me wrong, I'm not sure
someone could end up with the same quality on the Atari.

Don't get me wrong, I love my Atari more than anything else.
The problem is that a lot of people see the Atari as a computer that can't do
anything better than Pac-Man.
No offense intended, it's just a bad tradition.
Commodore owners ALWAYS want some evolution and are more demanding.
A "modern" program with lame graphics would NEVER be accepted on the C64.
The result is that games are generally better on the Commodore (except most of
the pre-85 classics) and some have a lot of depth, whereas lots of Atari
programs are merely souped up 2600 conversions with mediocre graphics and
sound.
The demos are pretty similar (maybe slightly faster on the C64), thanks to the
fantastic coding of some European programmers.

I don't like spam, but as long as the stuff being auctioned on ebay is
Atari related or at least even 8-bit computing related I don't have a
gripe about it.

Also, people who are willing to buy something are not always actively
seeking it out. If that were true, you wouldn't see stores advertise.
Heck everybody would already know it all already because they stopped
in and looked at everything they would be willing to buy. In reality
it doesn't work that way.

I don't know. I never had a XF551, only 1050s. My buddies CBM 1501 (or whatever the drive for the C64) were always had overheating problems. I know those did because the power transformer was in the drive if memory serves me correctly. The 1050s have the 110VAC transformed to (I think) 9VAC outside of the drive (at the wall plug), so that eliminates that porrtion of heat at least. Are the XFs like the Commie drives?

Of course ICD had to file off the numbers off the chips. As to Homan... it sounds like he is responsible for a lot of things NOT happening with the Atari8 as well. I say that because he was going to do such great things, but now what we have is he isn't and no one else can either because 'it wouldn't be fair to Mike.'

Maybe we can get around this with the Rtime, if off the shelf chip(s) can be used and firmware written to provide the same functionailty of the original RTime, then in my mind that is not a violation of copyright. PC clone makers reversed engineered IBMs BIOS to provide the same functionality but without copying the code itself. That was considered totally legal.

Actually VCS is just the initials for Video Computer System which
appears on all 6 and 4 switch, wood and black, consoles. 2600 is just
the model number. I beleive the 4 switch consoles have a model number
of 2600A. I don't know the exact model number of the 2600 jr.

: Can anyone reccomend a solution to repairing these items.

You probably need drive belts. A 410 has three belts, part numbers
FC100013, FC100014, FC100015. I think Best has 'em at 408-243-6950.

Vidar \"Hawk\" Olavesen (olavese@online.no) wrote:
: I remember a long time ago (in a galaxy pretty close) we had arguments
: about the C64 and the Atari 8-bits. I wondered if anybody uses both today ?
: I do, but still think the edge is on the Atari, except for the SID chip
: perhaps. Although I like the music of the newer polish games and demos on
: the Atari a lot.

Also, the Atari "sprites" were smaller, harder to use, and had less
colour options available -
they were 1st generation sprite technology perhaps?
C= were 2nd gen, and MSX-2 was 3rd gen?

Even though the Atari was less popular in the UK than the 64, it did
have an excellent magazine from Page 6 called "Atari User" which
published till at least 1991 before going hard-sale only.
And of course "Mercenary" and "Encounter" appeared on it before the
C64 versions. Ditto "Dropzone" and a pile of English Software
releases (Octapolis, Jet Boot jack).
Jeff Minter did a neat version of "Attack of the Mutant Camels", with
the skyline of graded colours versus the C64's black - but due to
sprite limitations the mutant camels were smaller.

The machine's parent company supported it better than Commodore did
for the 64 (face it, every other computer was better supported!).
But the pricing? Atari outpriced themselves from the market, at least
in the UK and here in Australia.
And the disk drive was a dog.
But the graphics chip was excellent (apart from the sprites)

So, the C64 and Atari, design-wise are roughly equal, the deciding
factor being that Commodore marketed the C64 slightly less badly
than Atari, aided by a better distribution system in Europe and
Australia.

>the same family (model?) of CPU, its amazing how different they all were.

The Ataris' processor speed was 1.79 MHz, and the 6502C was "C"o-opera-
ting with the ANTIC graphics processor (that was able to halt the CPU).
Additionally, the Atari had many video modes requiring 4K or less, the
C=64 apparently lacked such modes. I have only been told by (former)
C=64 users that "Rescue on Fractalus"' speed sucked - and I guess the
above clarifies why.

>The thing that really bothered me about the C64 was that pig-slow disk drive!
>Loading Seven Cities of Gold --- AAARGGH! I thought for sure there was a
>cassette drive hidden in there. The SID chip is very nice, and the sprite

Yup, bot OTOH the POKEY had also some nice features. Apparently it was
harder to program than the SID, but e.g. Rob Hubbard's "Warhawk" sound
track sounds better on POKEY than on SID.

The sprites _were_ far better than the Player/Missile concept. I guess
that's why Atari programmers invented their own animated objects so
often or even multiplied the Players in Display List Interrupts.

>Atari had one feature that rocked, and that was the 4 joystick ports... MULE
>anyone? JT was crazy to get rid of them.

That wasn't Tramiel's fault. The 800XL was invented and sold during the
Warner ownership, and it lacked port 3 and 4.

>Are the XFs like
>the Commie drives?

No. (From memory) the 1050 has a large "U"
shaped heat sink that gets quite warm. I don't
recall nearly as much heat sink area on the
XF551's. From the component count and the
more modern drive mechanism, it would
sure look like the XF would use less power.
Yes, C64/VIC 1541/1540's run quite warm. Starting with the 1541-II, they put
the power
supply transformer outside like all A8's. The 1541-II is a nice drive, and
when equipped with "Jiffy Dos" (by the people who make the
"Super CPU") it is very fast..

Maybe no-one you knew ;-) Most people I knew had Atari's, either 800s, 800xls or 130XEs. I only ever met one person with a C64 and they just had the machine and cassette deck for games whereas all the Atari people had disk drives, printers, modems etc and used the machines for all kinds of stuff like word processing, databases etc. One guy was even on a prototype of Barclays Home banking via a prestel emulator and a 1200/75 modem in 1983/84.

Jason,

Thats totally incorrect. From day one, Atari released the entire
source code to the OS for the 400/800, they were instrumental in the
release of DE RE Atari which is the bible to Atari computers, they released
External Release Specifications to all outside vendors for development of
hardware software. Atari was very open about development of product for
its line of computers and also supported third party startup programmers
through the APX group which was Atari Program Exchange, if a piece of
software was above average, Atari would assist in packaging and marketing
through the APX program.

Actually John Harris reads the group when he has time. He corrected some
miss information that was in Hackers including the Atari trade secrets
spin from Hackers.

There are several other glaring errors in hackers, Levy is more
interested in sales and or telling a good story. It was necessary for
him to create a few myths of his own to insure sales.

I *wish* I could remember all the details, but I think Levy was also an
author for Rolling Stone or some similar magazine where style & creation
of icons was more important then substance. He has also come out with at
least one other 'sensationalist' book dealing with mass murderers or the
Mafia, can't recall which.

I really liked Hackers myself, it was a good read & very entertaining
even if it wasn't accurate. Levy is a very good story teller, just that
Hackers shouldn't be considered history so much as a novel.

Remember, we're talking two different Atari's here.

Atari Inc. split up into Atari Corp. (computers/games sytems) and
Atari Games (arcade games and Tengen subsidiary, who did, say, NES versions
of Atari Games games like Hard Drivin' and Gauntlet).

This was mid 1980's.

Recently, like less than 3 years ago? JTS (a hard drive manufacturer)
purchased Atari Corp. and sat on it for a while.

Even more recently, less than a year ago, Hasbro bought Atari from JTS
and is now running(?) it under their Hasbro Interactive division.
That's why Hasbro's doing all the old Atari Inc. games over, like
Frogger and such.

: Area 51 used a modifed jaguar board! It had extra RAM and a hard disk I
: believe.

That's hard to believe for two reasons. (1) Could a Jaguar handle that!? ;)
(2) Why would Atari Games, a separate company that happens to not really
like Atari Corp., use Atari Corp. hardware?

BTW, I almost worked for Atari Games starting last summer, but was too
settled in my decision to live where I'm living (with my girlfriend :)
She's very lucky. ;)) I would have worked on their upcoming SFRush
sequel.

Windows? Mac? Bah! What's WRONG with you people!?

Just get Linux. RedHat 5.1 takes just minutes to install. It runs for
weeks on end without ever needing a reboot. It actually MULTITASKS.
If you're concerned about running software, well, we'll start with the
8-bit-related stuff, since this IS c.s.a.8!

* Worried about SIO2PC/APE? Try femul. If we support this more, it will
hopefully become an excellent replacement. (Right now, it's very
minimalistic, but man it works great!)

* Emulators? Atari800 works awesomely. I run it in full-screen (VGA) mode.
I'm sure it would help if I had better than a 133MHz pentium, but...

* Web browsers? Netscape. Lynx. What else do you need to visit your
favorite Atari websites?

* Word processing? Prefer Word over AtariWriter? Use Corel WordPerfect 8.0.
There's also ApplixWare and StarOffice if you want to pay for software. :)

* Graphics? There is NOTHING better than GIMP. It's like PhotoShop on
steroids. You've of course got layers, alpha channels (transparency),
support for oodles of graphics formats, animations (for animated GIFs,
for example), a SCRIPTING language. Shoot, you can run GIMP as a
server and connect to it and issue commands to make it do stuff!
Of course, besides scripts, it has plug-ins and filters.

* Worried about your interface? X-Window is great, especially once you
get use to it. (it's a little odd compared to Mac or Windows)
And rather than get stuck with one interface (ie, Windows or Mac), there's
a BUNCH of Window Managers out there, most VERY user-definable!

Besides that, Linux distributions usually come ready to run as webservers,
file servers and FTP servers.

Most everything you'd ever want to get for Linux can be had for free,
lots of things come as source so you can poke around and tweak them if
you feel so inclined.

And now with backing from huge corporate companies like Intel,
Netscape (AOL? :)), Oracle, etc., Linux is becoming quite a buzz.

And with many different people producing Linux distributions, you're not
stuck with one sucky company's idea of what they think you need.

Oh, and did I mention, Corel Computers is coming out with a Linux Computer? (It's a tiny little DC-powered machine with lots of RAM and HD space inside).

And Compaq (and soon others) are now officially supporting Linux, with desktops and servers with Linux installed (instead of Win98) and with 24/7 phone support? :)

Cool, no!? :)

Actually, the C64 has 2 families of screen modes: character-based and bitmap. Character-based use a byte for each of the 40x25 cells, plus a nybble in I/O space for the color of each cells. That means you're using 1000 bytes for the screen, and 1000 nybbles for color (which can be banked out of address space, leaving only 1000 bytes of system RAM being used). In these character modes, you can define 256 8x8 characters, or use multicolor 4x8 (wide pixel), or extended color mode, where you can define both the foreground and background of each char, etc. It's actually pretty easy to do parallax scrolling with an 8x8 pattern just by manipulating the font definition. All of the bitmap screens use 8000 bytes (1 bit per pixel on screen), and those are usually kinda slow, because they bytes aren't arranged linearly. Using multiplexed sprites (24x21 pixels each) or rectangular arrays of characters, you can achieve an easier-to-address, yet smaller in size, "bitmap" area.

I have an Atari 800XL. With a tape drive. Need I go on...? =-)

(Half a piggin' *hour* for Elektraglide... Okay, so the game was nearly
worth it but... =-)

> I love both machines now, and love talking about them. Still not
> crazy about those Apple IIs, though..... ;)

I've never had a play with an Apple II, but from the info I've seen they
don't really seem to be all that much... I was fond of the Atari and if
we'd had the same support for it here as the C64 had/has I *might* have
got a drive and kept with it.

I never found any decent tools though, it was hard enough getting games
'round here...

> "C"o-opera-ting with the ANTIC graphics processor (that was able to
> halt the CPU). Additionally, the Atari had many video modes requiring
> 4K or less, the C=64 apparently lacked such modes...

Nope, our stock, power up mode is 2K, as are most of the modes used by games. Our bitmap mode is either 9K for mono or 10K for multicolour. One mode we *lack* is an equivalent to the one on the Atari that extends the screen horizontally. We *can* take the sideborders out using a bug in the VIC-II but it's heavy on the processor time and a git to make.

> ...I have only been told by (former) C=64 users that "Rescue on
> Fractalus"' speed sucked - and I guess the above clarifies why.

Not really, our CPU only pulls 0.98Mhz (PAL) and the refresh rate difference is noticeable but not *as* bad as some would have you believe. Considering the fact that it's only just over half the processor power, Fractalus, Koronis and Mercenary all pull what I'd consider a reasonable speed in comparison. Elektraglide on the C64 stood no chance, though... =-)

> ...bot OTOH the POKEY had also some nice features. Apparently it was
> harder to program than the SID...

If my memory of the 800XL is right, the SID is the more complex chip to work with, every sound has ADSR, filtering, waveform and assorted modulation effects. These are, however, shaky memories of the Atari.

> ...but e.g. Rob Hubbard's "Warhawk" sound track sounds better on POKEY
> than on SID.

Because Warhawk is, by sound standards rather than tune, a primitive track even if the CPC AY version managed to murder the thing... =-) Most of the tunes that came later, like Tim Follin's "Ghouls 'n' Ghosts" (with the rain noises and what *sound* like sampled screams) and JCH's "Orcus" (which uses ring modulation to make what sounds quite like a vocoded voice speaking along to the soundtrack) would be a *lot* more difficult.

One thing I don't know about the Atari is if it can handle samples and FM at the same time?

> The sprites _were_ far better than the Player/Missile concept. I guess
> that's why Atari programmers invented their own animated objects so
> often or even multiplied the Players in Display List Interrupts.

Same as we can do with sprites, of course. Record stands at 144 by
Crossbow/Crest.

>
> Sorry, but I don't buy it.

DeRe Atari came out after the Atari 400/800 were released, again though the Atari OS Source Code listing was immediately released, Atari also released the SIO bus specifications for development of SIO based devices. As for Hackers, that book is riddled with inaccuracies and I'm not sure if you typo'd when you wrote Apple, but if you talking about John Harris your talking about the Tramiel-Atari era from July 1984-1996 and that was well after the earlier Atari 400/800, XL line and the Warner-Atari era was more open to supporting programmers and hardware developers. The Tramiel-era had abyssmal support for its developers.

I have made a life's side-work out of Atari History and know this information a little bit better then most, especially since I have a large archive of most of Atari's original internal paperwork and also keep in touch with over 50 former Atari employees.

Nitpicking, but so far the only thing Hasbro's done with the Atari rights is Centipede. (out for PC CD-ROM, and soon for PlayStation)

Hasbro did re-do Frogger was well, but that was before they bought Atari from JTS. Frogger was by Konami.

Combine all the chips of the Atari into one, and add 128K RAM, sorta
like a super Basic stamp. Have it be able to run at 1.79mHz for
compatability, and also 25 or 30mHz.

That would be an incredible!

Well, thats what I'm talking about. But, I can't write the drivers
unless I know what the output should look like. To be perfectly honest,
I was hoping to make something that acted just like a rtime8 (but be
current) so all the compatability issues wouldn't be an issue.

Rescue on Fractulous for the c64 runs perfect (except the version that doesn't run right on the c128) in my opinion, I don't even bother with the scpu at all when playing this game (I own Rescue on Fractulous and the spcu and they are fast).

OOHHH, Yeeaahhh, now that would take two or three floppies -- maybe
even more for that! ;-)

Actually, I download to a ramdrive rather than a floppy. Then I split
everything up and gzip the chunks. Then I move them to the floppy. It
is really much more convenient for me to do it this way, because I
take the floppy everywhere and I can use my own stuff on just about
any computer.

I haven't seen a desk-top computer yet that will fit into a shirt
pocket. ;-)

A bit, but then it was written by such luminaries as Chris Crawford of
Eastern Front fame so it was worth it.

I would have to check my "Atari Technical Reference for the 400/800
Computers", but I thought is was copyrighted around 1979.

IMO: Given how things are done now, that is advance specifications are
done & circulated before a product sees the light of day, there may have
been a bit of a delay at Atari to give their programmers a slight lead,
but it is hard to say for sure.

I live in the area & know more then a few people that worked at Atari.
The amount of confusion & just plain goofyness that went on there is
incredible. Figure any company that bases the names of projects on the
names of women with big hooters is going to be more then a little
offbeat.

W/O naming names since he follows this newsgroup too, someone once told
me about a guy at Atari that insisted he be paid in $50 bills. I can't
remember if he insisted Atari give him the money or if he just got $50s
from the bank when he cashed his check. Punch line is he had the thought
there could be counterfit money circulating & he knew the $50 was so
hard to counterfit that most crooks just do 20s & 100s so....

I don't think he was out of place at Atari: People zoo.

Had some really amazingly talented people too. One time I let all the
magic smoke out of my homebrew computer. I really gave up, chips,
traces, everything gone up in smoke. I had made a 44 pin daughter board
for some A/D & a little I/O. Plugged it in backwards to give you some
idea of how much I hurt that puppy. Found a tech at Atari to look at it
for me, I think he found about 6 fried chips, wire wrapped all the
missing traces, replace fried chips with ones he had laying around <this
was back when 4 bit X 256 Intel chips were $5 a pop>, & ended up
charging me $10 or so.

I have several copies of each of the following atari 8 bit software for sale. All items are new/sealed/complete. Orders over $50 receive a 10% discount.

The titles are grouped by publisher:

Software Published by Atari
CXL4013 Asteroids (Cartridge) $7.50
AX2020 Atari Music I (Diskette) $7.50
AX2026 Atari Music II (Diskette) $7.50
RX8064 Ballblazer (Cartridge) $7.50
CXL4020 Centipede (Cartridge) $7.50
RX8104 Crime Buster (Cartridge) $7.50
RX8088 Crossbow (Cartridge) $7.50
RX8083 David's Midnight Magic (Cartridge) $7.50
CXL4025 Defender (Cartridge) $7.50
RX8089 Desert Falcon (Cartridge) $7.50
RX8026 Dig Dug (Cartridge) $7.50
RX8039 Eastern Front 1941 (Cartridge) $7.50
RX8030 E.T. Phone Home! (Cartridge) $7.50
CX421 Family Finances (Diskette) $7.50
RX8067 Final Legacy (Cartridge) $7.50
RX8079 Food Fight (Cartridge) $7.50
RX8029 Football (Cartridge) $7.50
RX8024 Galaxian (Cartridge) $7.50
CX415 Home Filing Manager (Diskette) $7.50
RX8048 Millipede (Cartridge) $7.50
CXL4012 Missile Command (Cartridge) $7.50
RX8052 Moon Patrol (Cartridge) $7.50
CX4007 Music Composer (Cartridge) $7.50
RX8108 Necromancer (Cartridge) $7.50
RX8093 One on One Basketball (Cartridge) $7.50
RX8022 Pole Position (Cartridge) $7.50
CXL4027 Qix (Cartridge) $7.50
RX8063 Rescue on Fractalus (Cartridge) $7.50
RX8033 Robotron: 8024 (Cartridge) $7.50
CXL4008 Space Invaders (Cartridge) $7.50
CXL4011 Star Raiders (Cartridge) $7.50
RX8113 Thunderfox (Cartridge) $7.50
DX5047 Timewise (Diskette) $7.50

Software Published by Coleco
9725 Wargames (Diskette) $7.50

Software Published by Imagic
IZ4203 Atlantis (Cartridge) $7.50
IZ4200 Demon Attack (Cartridge) $7.50

Software Published by Sierravision
SRL307 Crossfire (Cartridge) $4

Software Published by Spinnaker
Aerobics (Diskette) $3
Delta Drawing (Cartridge) $3
Facemaker (Cartridge) $3
Fraction Fever (Cartridge) $3
Snooper Troops (Diskette) $3
Story Machine (Cartridge) $3

Please email offers to rsmith@planeteer.com

I love Mac but they are TOO expensive and it's hard as hell to find
software support, SO I get a WinTel machine anytime I need a new 'puter
in a hurry and low on cash.

Since we are comparing Coms w/ Ataris, how would the PET and the Atari
400 compare w/ each other?

Laters,

antbaker@arn.net

Just updated my 2600 Section on my Home page. I should have the Atari800

Section up by this weekend!

http://homepages.infoseek.com/~mrnukem/index.html

Thanks
Derek

For sure, I'm not as accurate about dates as, let's say Curt is.. however.. there's no doubt that Atari release the OS very early. I have Atari's Technical Reference notes loaded with detail... it's dated 1982...released under Warner.. for sure I got them, and my 400, around 1982... the problem Atari had.. and every other maker out there.. was how to win over a fragmented market.. remember.. you had the 400, the 800 the vic 20.. the TI... the Sinclair(!)... we probably all wanted to see more from ATARI themselves.. there's no doubt.. lots of small entrepenaurs made some quick money... from software to keyboards, to memory systems.. IF Atari had been just slightly faster, we'd have a little more uniformity in the various 'add ons' out there..

B'rgds,
Vinnie

yes but if it wasn't a problem on the 800 why would it be a problem on the xl/
xe? from my understanding they are almost identical....btw does anyone know
where i can get some 65ce02's? i would like to get a few and toy around with
them again... the ones i had i gave to a friend.....

sloopy.

is there a program for the mac that allows me to use it as a drive for my 8bit? i havnt run across any but then i havnt look too hard....

also i am looking for a rom for the supra/k product hdd interface.. i have tried to mail bob and left msg's here for him but i get no response so i hope someone else has a rom for it... (i bought the interface used and the rom was put in backwards so it got blown :'(so if any has one and want to sell it or has a mio for cheap....

sloopy.

Yeah, I hardly ever saw Ataris for sale around Canberra, but there were c64s everywhere you looked. One thing I noticed was there were many flavours of the 8bit Atari, but only ever one c64.

Not so long ago I was at the local rubbish tip and found a whole pile of Atari computers and peripherals in great condition. I would have liked to have taken them all but I already had a mountain of C= stuff. There's too many orphans in this world for one person to take under their wing. :)

How about coming in here and live and let live, and maybe throwing
something a bit more posative around? Sheesh. I love emulating the
Atari8 on a PC. Can you think of anything more fun to emulate?
Besides, in a strange way the Atari8 sort of lives on through the PC
longer. I think the emulation scene breathes a lot of life into
something that would otherwise be dead or very close to it. And
before you ask, yes, I do have the real equipment as well.

WOW! Your original message has produced alot of responses. Here's another VERY LENGTHY but informative one:

The Atari 8-bit line, selling in 1979, is a full 3 years older than the C-64, which, I believe, began selling in 1982. Heck, The Atari is even older than the miserable Commodore Vic-20! Considering the age difference (which, for the computer field, should be measured in dog years) the Commodore should have had alot more advantages (hardware wise) over the Atari than it did. Consider this: In just a little over 3 short years (same difference in timeframe as between the Atari and C64) the Amiga, which which had a quantum fold increase in capabilities over previous computers, began to sell.

When the Atari came out it (in 1979) it was hands down the cadillac of computers that suffered from one major hardware problem: standard RAM limited to a paultry 8-16K. Many Atari programs, therefore, had to be coded for this pitiful amount of memory. Because of a drastic reduction of RAM prices by 1982 Commodore was able to include a full 64K as STANDARD! Because of Commodore's cheap price and full complement of RAM, the Atari quickly lost favor and most programmers (and companies) began coding exclusively for the C-64. In addition, the C-64 became exceedingly popular in Europe which was (and is) the breeding ground of by far the best game and demo programmers OF THE WORLD (Just compare the difference in quality between American Amiga programs and European Amiga programs and you'll understand. The difference is ASTOUNDING.)

Now here's a list of specific issues between the C64 and Atari 8-bits:

SOFTWARE

After about a year of the C-64's existence, it became the defacto standard for 8-bits and, therefore, most other competing systems either quickly died or lingered in the sidelines. Atari's suffered the latter problem. On top of this, a few years later (mid 80's) the C-64 gained a second life (comparable to the second coming of CHRIST) and made MAJOR in-roads in the European market, creating a massive flood of truly great software that has only recently been equalled by the PC compatibles.

WINNER: C-64

RELIABILITY

From day one, C-64's were notoriously failure prone machines. For the first six months of production, the failure rate of C-64's out of the box was about 50%!!!!!!! Many, many, many, many computer magazines of the time had written about this "little" problem. Even if one got a "good" C-64 is no guarantee that it'll stay working a year afterward. Being a garage sale nut I can attest to many sob stories from former C-64 users that were selling off their equipment. One even had his joystick ports taped up claiming that they're sensitive to static electricity.

Atari 8-bits, on the other hand, were quite reliable. This reliability, however, did get slightly reduced when Jack Tramiel (former owner of Commodore) took over Atari and manufactured the updated Atari 8-bit XE machines and especially the (then new) 16 bit ST machines (with failure rates as high as 50 %!!! Hhhhmmmm. Rumor has it that many ST failures were traced to trucks hitting speed bumps in front of the Atari factory, thus causing some socketted chips to become un-socketted.)

I've got about 30 Atari 8-bits and an equal number of C-64's. Of those, one Atari and about 8 C-64's are doorstops.

WINNER: ATARI

DISK DRIVES

I have a large collection of old computer magazines and found Commodore advertising for the C-64's 1541 disk drive. Following truth in advertising (a first for the computer industry) Commodore claimed the disk drives were FASTER THAN A TYPIST!!!! All I can say is ...not by much!!!!

Both the C-64 and Atari 8-bits use a slow serial connection for the transfer of data between the computer and disk drive (Apparently, FCC approval is faster for serial standards than parallel standards). Apples used a parallel standard that was much, much faster (I swear, some Apple games could load up a title graphic display *before* I turned on the machine. Now that's fast!). Unfortunately, in order to cut costs of including a hardware UART chip, Commodore implemented the serial transfer in SOFTWARE #%$%#^##$^%!!! (I must say, Commodore was ahead of their time...A full 15 years later, modem companies are beginning to sell cheap "software" and "win" modems for the PC which only reduces the effective speed of a Pentium 200MMX by a measly 50%!!!) Commodore transfers occured at a rate of "no greater" than 2400 bits per second and usually significantly less. Atari's serial SIO port allowed for a transfer of 19,200 bits per second but usually ran about half that speed (9,600bps). On average, the Atari disk loading was about 4 times faster!

Also, the Atari's serial SIO standard was very flexible. (So flexible, in fact, that I like to call it a serial version of SCSI.) SIO allowed EASILY for up to 8 disk drives to be connected at once (four Atari

manufactured drives) as well as printers, modems, and whatever else a manufacturer could come up with. Commodore allowed for up to two disk drives. Unfortunately, in order to add a second disk drive you literally had to cut a trace on the second drive's circuit board to access it as drive number 2.

Atari's DOS was also amazing. All DOS options could be accessed via a menu screen (Dos Utility Package or DUP?). What could be simpler? The following line is all that's necessary to load up the menu:

DOS

Or the alternative method is to simply take out the BASIC cartridge before you turned on the computer and automatically load DOS from disk

Commodore's file management was absolutely primitive in comparison and relied on typing arcane device numbers (that had to be memorized). Here's an example of displaying a file list from drive number one: (note: I apologize if I make a mistake)

```
LOAD "$",8,1
LIST
```

Please bear in mind that Atari's DOS is in no way perfect. I could easily think of a half dozen major problems (which were corrected by other manufacturer's DOS replacements such as SPARTADOS, ADOS, etc). The upshot is that, because of Commodore's horrendous DOS, alot of people who bought C-64's ended up throwing them in a closet, never seeing the light of day again.

WINNER: ATARI

MANUALS:

The C-64 came packaged with an incredible plastic bound programming manual that had everything. (Basic keywords, memory map, programming tips and examples, hardware explanation and even chip pinouts and even theory of operation!)

Atari's manuals were your standard bit of fluff that was thinner than the included catalog of products (some earlier Atari's also came with a reasonable BASIC programming manual but contained only passing info on Atari's graphics and sound hardware).

WINNER: C-64 BY A LANDSLIDE

BASIC:

This one's tough. Unlike the Atari, the C-64 contained a standard version of Microsoft Basic which made it extremely easy to port simple BASIC programs from other computer platforms. However, ATARI's basic excelled in the support of it's graphics/sound hardware. The C-64 Basic HAD ABSOLUTELY NO SUPPORT FOR IT'S HARDWARE! A programmer for

the C-64 litterally had to resort to POKE's and PEEK's and Machine code to achieve what the Atari could do with a few simple lines of BASIC code or buy a separate BASIC extender utility such as SIMON'S BASIC.

WINNER: NONE

SOUND:

This one's tougher than it seems. Here's a rundoun of the capabilities:

C-64: (SID chip) three 16-bit voices with full control of ADSR (Attack Decay Sustain Release) which allowed a good programmer to simulate various musical instruments. Unfortunately, the volume of all three voices had to be set at the same level. Weird!

Atari: (POKEY) four 8-bit voices that could individually output both pure and unpure (raspy) sounds. Unlike the C-64, each Atari voice could be set at a different volume. Each pair of voices also could be combined for a true 16 bit voice (for a maximum of two 16 bit voices or one 16 bit and two 8 bit voices). Voices could also be combined (cutoff?) for very strange echoing sounds that were wonderfully taken advantage of in DEFENDER. NOTE: Atari's POKEY chip had also been used in many arcade machines at the time and, therefore, many arcade ports contained faithful sound reproduction.

WINNER: NONE

GRAPHICS (COLOR)

The C-64 has a total of 16 colors (which includes black, white, and a couple of grey shades). The Atari has a total of 128 colors (256 in one weird blocky mode). Please note that the maximum colors for each platform DOES NOT mean they are all easy to display on the screen at once. The number of actual displayable colors is closer to just 4 within any specific area of the screen (some reasons for this will be mentioned again, later on). The upshot is that C-64 games all seem to have the same boring color set wheras the Atari's color display appeared lively in comparison.

WINNER: ATARI

GRAPHICS (SPRITES)

Sprites are "hardware based" objects on the screen that are extremely limited in size and can be independently moved around without having to redraw the background screen (thus saving the processor from performing a multitude of unnecessary calculations that could instead be used for other more important things). PC compatibles do not usually contain this ability and something as simple as the Win95

mouse pointer has to be repainted one pixel at a time when either the pointer moves or the screen gets updated. this is why the Win95 mouse pointer blinks so damn much (HATE IT! HATE IT! HATE IT ALMOST AS MUCH AS EWOKS!). In comparison, the Amiga's mouse cursor is a sprite and is always rock steady no matter what is happening in the background.

Atari's sprite system is very primitive in comparison to the C-64. It essentially supports 4 sprites (actually called Player Missile Graphics) 8 pixels wide and 255 pixels tall. Each sprite can have only one color which is independently set from the Atari's 128 color palette. Sprites can be easily moved right and left but, in order to move up or down, each individual line has to be shifted upward or downward via the CPU. There are also 4 mini sprites (called missiles) that are only two pixels wide and 255 pixels tall. They can be combined for a fifth 8 pixel wide sprite. The Atari hardware can tell the program when one sprite "collides" with another or with a specific background color. Collision sensing, when not supported in hardware, can be extremely CPU intensive. I've noticed that none of the "faster" IBM PC Atari emulators support this capability and, therefore, makes a subset of Atari games unplayable on the PC.

Commodore's sprite system is much more sophisticated. I believe the C-64 has 8 separate sprites, each one being 24 pixels wide by 24 pixels tall, each having 3 colors.(Note: some sprite colors are shared by all sprites). Also, C-64 horizontal sprite resolution is double of the Atari sprite resolution (ie. one pixel of an Atari sprite is equal in size to two pixels of a C-64 sprite. C-64 sprites can easily be moved both horizontally and VERTICALLY. I don't believe hardware collision detection is supported. (someone please tell me if I'm in error)

WINNER: C-64

GRAPHICS (SCROLLING)

Both computers support the ability to scroll the display both vertically and horizontally via hardware support (ie. without forcing the CPU to move every dot on the screen to simulate scrolling). Apple computers don't have this ability. Ever noticed the "tearing" that occurs with games written on Apple comuters? This occurs because the CPU can't repaint the entire screen before the monitor displays a new frame (which must occur 60 times per second in North America and 50 times a second in most of Europe). Starting with the VGA standard, IBM's also have this ability, but is not always taken advantage of because third party video cards don't always implement it properly. Ah, the joys of "standardization."

Unfortunately, the C-64's hardware scrolling is limited and, when implemented, necessitates the use of a smaller display screen (with larger, much more noticeable black boards). Also, after moving the screen 8 pixels either horizontally or vertically, the screen ulimately must be repainted one pixel at a time.

One minor C-64 advantage: The C-64 can scroll at double the resolution of the Atari (ie. every two pixel C-64 scroll is equivalent to a one pixel Atari scroll).

WINNER: ATARI

GRAPHICS (TEXT)

Both the C-64 and Atari can only display 40 colums of text (Atari, with overscan, can support up to 48 columns). Atari's text is "monochromatic." It can only support "1 and a half" colors. Atari's text can only be a lighter or darker shade of the background color (ie. a dark blue background and light blue text). Commodore's text display allows for the ability to INDEPENDENTLY set the color of EACH character on the screen.

WINNER: C-64

GRAPHICS (MODES and MEMORY USAGE)

Because the Atari was created when RAM prices were outrageous, there are many display modes/resolutions geared toward minimizing RAM usage. Most of these modes are very blocky and quickly became useless when the addition of more RAM became the norm. Sometimes, though, reduced RAM usage can be an advantage when screen updating speed becomes more important than resolution. LUCASFILM'S RESCUE ON FRACTALUS (BENEATH JAGGI LINES) is one of those games that take advantage of this Atari quirk and plays much better than the C-64 version.

Atari's graphics subsystem also allowed for something that has no parallel on the C-64: DISPLAY LISTS.

A display list is a simple and ingenius way of telling the Atari how to display a vertically stacked series of graphics lines on the screen. Remember, the Atari has over a dozen different display modes, some being bitmapped (all points -or pixels- are freely addressable) and others being text based (where a single byte in RAM ultimately represents an entire character "cell" on the screen). With the DISPLAY LIST, any combination of these modes can be on the screen AT ONE TIME. These individual lines can also be set for a combination of vertical and/or horizontal fine scrolling as well as something called a DLI (Display List Interrupt) that allows the hardware to force the CPU (6502) to do something special at a specific point of the display screen. WHY? Lots of things such as: changing the base color set for such things as that weird rainbow color rotation effect that only the Atari could do, sprite multiplexing (displaying more than the maximum of 4-5 sprites), and sound hardware modification. It was INCREDIBLE! Also, the RAM locations devoted for the Atari's display isn't fixed. I remember writing a small 10 line BASIC program that could literally scroll through the entire 64K of memory. WOW! Using a combination of the above capabilities, PARALLAX SCROLLING (seen in MOONPATROL) becomes fast and easy.

In comparison to the Atari, the C-64's number of display modes appear grossly inadequate. There's just three major modes: text (40x25), medium res (160x200), and high res (320x200). Believe it or not, like the Atari, most games for the C-64 are written in 40x25 TEXT MODE with a redefinable character set. WHY? Because it's faster (and more memory efficient) to manipulate 1Kilobytes of data than it is to manipulate 8 Kilobytes of medium and high res graphics. The one saving grace of the C-64 is something that (believe it or not) the Atari doesn't have: a special half kilobyte of COLOR RAM which allows small 8x8 areas of the screen to have a limited (but important) amount of separate color control. The C-64, through RASTER INTERRUPTS, also allows for the 6502 processor to be interrupted at a certain point of the screen. Unfortunately, the C-64's RASTER INTERRUPT method isn't as flexible and takes a great deal more effort to accomplish more than one interrupt on the screen. Also, because the C-64 doesn't have a DISPLAY LIST (which allows the Atari to easily display multiple graphics modes on the screen) the C-64's only method of mixing display modes on the screen is through the use of RASTER INTERRUPTS.

Also, I mentioned above that most games use text mode with a redefined character set. The C-64's character set redefining is better. It allows for the display of a fulll 256 separately defined blocks. The Atari only allows for half (128). This problems can be circumvented on the Atari by changing the character set pointer in midscreen during a DISPLAY LIST INTERRUPT.

WINNER: ATARI (with the pie-in-the-sky wish that it had C-64 style color RAM)

CPU SPEED

Both the Atari and C-64 use the 6502 processor (C-64's version is a slightly customized version but not any faster than the generic version). the C-64's 6502 is clocked at 1.02 Megahertz. The Atari's 6502 is clocked at 1.79 megahertz.

Judging from the above specs, Atari's are about 60% faster than the C-64. However, there's a very major caveat. Unlike the C-64, Atari's display hardware steels cycles from the 6502 processor, thus degrading the apparent speed of the Atari. The amount of "cycle stealing" is dependent on resolution and number of colors the Atari must display. Believe it or not, the worst offender is 40 column text and multicolor (what most games use) modes, which reduces the Atari's effective speed to 1.2 Megahertz. Sprite implementation also also has an impact (don't know the exact amount but don't believe it's significant).

The upshot is that, under normal circumstances, the Atari's are closer to 20% faster than the C-64

WINNER: ATARI

JOYSTICKS/KEYBOARD

The keyboard "feel" is subjective. Both computer platforms have their strengths and weaknesses. Also, there were many more styles of Ataris (and keyboards) than the C-64. Atari 1200 keyboards were the best, Atari 800's were good, Atari 800XL's were so-so, and the Atari 400's membrane keyboard was just plain horrendous (but not quite as bad as IBM PC JR's chicklet keyboard). C-64 keboards had a good "feel" but seemed a bit "smaller" than a standard size keyboard.

Why am I even talking about joysticks? After all, C64's and Atari's use the same ones. The problem lies in the number of joystick ports. The older Atari's had 4 and later models had 2. C64's had only 2 with one additional problem. For some reason, keboard access on the C-64 interfered with reading the first joystick one, which effectively made a computer with ONE JOYSTICK PORT.

Now remember I said the original Ataris had 4 ports? and the later models had 2? Why the change? Apparently, ATARI felt the number of games that used ports 3 and 4 were few (MULE being the exception) and they wished to reduce costs of production. So far not a major problem. The real stupidity lies in Atari's re-use of the hardware "port", that was originally used for reading the second pair of joysticks, for bankswitching additional RAM memory that underlied the ROM based operating system. The problem is that many programs, as part of their initializing routiner, would reset all the hardware registers by writing zeros into the entire register space. Unfortunately, doing this to the new bank switching port causes the operating system to be switched out. Without the operating system the computer immediately CRASHES! STUPID ATARI!!!!!! Luckily, programs could easily be modified to prevent this crash. I've even done it myself with BERZERK and a few others. Still, it was a major headace for many Atari users who upgraded to the new Ataris

WINNER: ATARI

And what did Atari's Star Raiders do first? It didn't have parallax scrolling. Was it the first to display a StarTrek like moving starfield? Whether or not it was a "first" at anything I still think it has a place in history as one of those few games that had a major (and I MEAN MAJOR) impact on many people. Wasn't this game on the top ten sales charts for well over a year? That in itself would be miraculous nowadays.

The primary failure in a C64 is the crappy power supply they were originally chipped with, no argument there.

Some had failures of other components as well, most noteably the PLA.

That said, I've never had a machine completely fail on me in the last 15 years, though I've managed to kill a few by hacking and playing witht he hardware.

> 2400 bits per second and usually significantly less. Atari's serial
> SIO port allowed for a transfer of 19,200 bits per second but usually

> loading was about 4 times faster!

The standard loading speed on a C64 is anywhere from 2400 BPS to over 25,000 (25 thousand) BPS.

The latter is accomplished by replacing the Kernal with an updated one, which can be found at many sources.

Alternatively, you can load a fat-load routine, which is usually only a few K in length anyways.

Most software used fast-load routines that average 10000 BPS or so.

There are still speeder chips and cartridges available today, such as JiffyDOS and The Action Replay cartridge.

> manufacturer could come up with. Commodore allowed for up to two disk
> drives. Unfortunately, in order to add a second disk drive you
> literally had to cut a trace on the second drive's circuit board to
> access it as drive number 2.

The Commodore serial bus allows for up to 22 devices. The drives that Commodore made allowed for up to 4.

Older 1541's had two jumpers inside the drive which could be cut to change the device number. The default is device #8.

Alternatively, you can "softwire" a drive to temporarily alter it's device number.

Anything made after the 1541-II drive, has switches in the back that can be flipped with a ball-point pen, to alter the device number.

CMD FD and HD drives can be set to any of 8 possible numbers by hardware (FD only) or the full 22-device range in sofware (HD and FD, HD retains it's device number permanently even after shutdown).

> Commodore's file management was absolutely primitive in comparison and

> Here's an example of displaying a file list from drive number one:
> (note: I apologize if I make a mistake)
>
> LOAD "$",8,1
> LIST

You made two mistakes here.

1) You don't use a ,1 when loading a directory, else it'll overwrite screen memory.

2) Any idiot already knows to get a DOS extension program to take care of this problem. Commodore even supplied one on thier 1541 Test/DEMO disk called "DOS 5.1".

You load it, SYS 52224 and the wedge is active. It stays out of the way of BASIC programs, and most smaller ML extensions are compatible as well.

With it and any other DOS extension (JiffyDOS and virtually all utility cartridges), a simple command like...

@$

...displays the disk directory immediately, without having to load it first.

> Please bear in mind that Atari's DOS is in no way perfect. I could
> easily think of a half dozen major problems (which were corrected by

> The upshot is that, because of Commodore's horrendous DOS, alot of
> people who bought C-64's ended up throwing them in a closet, never
> seeing the light of day again.

All of the C64's DOS, Kernal, and disk speed shortcomings are taken care of as well shortly after it's release.

Commodore even saw fit to release an updated DOS in thier Commodore 128 series, which contained a much better DOS structure as well as faster serial speeds.

> BASIC code or buy a separate BASIC extender utility such as SIMON'S
> BASIC.

Or download one off your favorite BBS.

BASIC extension programs have been around for years. The first one I got toplay with was SuperBASIC, which was a type-in program in Compute's First

Book of the Commodore 64.

Sure you had to buy the book, but most anyone who needed the program could find someone who had it back then.

> C-64: (SID chip) three 16-bit voices with full control of ADSR

Three 8-bit voices.

The 16-bit facility is the frequency register. The actual output is 8-bits, while internally the waveform is 24 bits.

> once. The number of actual displayable colors is closer to just 4
> within any specific area of the screen (some reasons for this will be

The C64's limit was destroyed with the advent of FLI, IFLI, UIFLI and other extended graphics modes.

Any dusty old C64 can display these modes right outof the box. It was a matter of using the hardware more fully.

> Commodore's sprite system is much more sophisticated. I believe the
> C-64 has 8 separate sprites, each one being 24 pixels wide by 24

24 by 21.

> pixels tall, each having 3 colors.(Note: some sprite colors are
> shared by all sprites). Also, C-64 horizontal sprite resolution is

You can mix and match 3-color and single-color sprites as you please. #-color sprites have a resolution of 12x21 (where each pixel is composed of two hires pixels, to get the extended color info).

> can easily be moved both horizontally and VERTICALLY. I don't believe
> hardware collision detection is supported. (someone please tell me if
> I'm in error)

Hardware collision is fully supported for both Sprite-to-sprite and sprite-to-background-data collisions.

The VIC chip will detect either type of collision and set bits appropriately in it's collision registers. Those bits remain set until they are read.

> Unfortunately, the C-64's hardware scrolling is limited and, when
> implemented, necessitates the use of a smaller display screen (with
> larger, much more noticeable black boards). Also, after moving the
> screen 8 pixels either horizontally or vertically, the screen
> ulimately must be repainted one pixel at a time.

Unless you use FLD or VSP, tricks which cause the VIC chip to move the screen for you an unlimited distance either vertically or horizontally.

Again any dusty old C64 can do this right out of the box.

> Atari's graphics subsystem also allowed for something that has no
> parallel on the C-64: DISPLAY LISTS.

<snip descripotion of display lists>

Most of the techniques and display methods you describe here have been done to death on the C64. Displaying a text screen along with hires and multi color bitmaps, and other modes in between....

I've seen it all. In fact, I've even used one or two such display types in old programs.

Any dusty old C64 has this capability right out of the box. This includes manipulating the sound and other chips as well. Most demos use these effects.

The C128 even had a couple of split-screen modes built into it's operating system.

> In comparison to the Atari, the C-64's number of display modes
> appear grossly inadequate. There's just three major modes: text
> (40x25), medium res (160x200), and high res (320x200). Believe it or

You forget other modes such as FLI, IFLI, and UIFLI.

> the screen. Unfortunately, the C-64's RASTER INTERRUPT method isn't as
> flexible and takes a great deal more effort to accomplish more than

The rester interrupt method used on the C64 is quite flexible.

It takes two lines (5 bytes) of code to move the raster interrupt position around on screen:

```
LDA $D019 ; Clear interrupt source
LDA #somerasterline ; Set new interrupt.
STA $D012
```

The hardware will take care of resetting the interrupt to occur at the new position.

Display lists, unless handled entirely by the video hardware, are nothing unique to the Atari. If the program has toprocess the display list to keep it active, then ithas no real advantage.

> graphics modes on the screen) the C-64's only method of mixing display
> modes on the screen is through the use of RASTER INTERRUPTS.

Or one can use the tried and true method of waiting for the desired rasterline (by polling $D012) before triggering the desired effect or display mode.

Most demos use this method, as it requires less overhead than a raster IRQ.

> Atari only allows for half (128). This problems can be circumvented on
> the Atari by changing the character set pointer in midscreen during a
> DISPLAY LIST INTERRUPT.

As can the C64.

> Judging from the above specs, Atari's are about 60% faster than the
> C-64. However, there's a very major caveat. Unlike the C-64, Atari's
> display hardware steels cycles from the 6502 processor, thus degrading

As does the video chip in the C64. Disable it (by turning off the display
via a register in the VIC) and you get about a 10% increase in speed.

> one additional problem. For some reason, keboard access on the C-64
> interfered with reading the first joystick one, which effectively made
> a computer with ONE JOYSTICK PORT.

Nope, it's just a bug in the C64's stock keyboard read routine.

Any smart programmer knows how to separate keyboard accesses (point shorts
in the keyboard matrix) from joystick movements (entire rows or columns
being grounded).

Compute was one magazine that published a type-in driver program for this
very thing.

Seems to me that in many of the places where you say the Atari is the
winner, the result is really the opposite or a draw.

You need to double check your facts before you compare two machines. I
don't know anything about the Atari, so I'll take your word for it that what
you state is correct.

I was going to avoid this - but i'm not! :)
I am a die hard Atari fan (i've used a C64 a few times, but for overall speed, usefulness, and for playing games, Atari, for me, always wins hands down) Now, if i can get past my own personal bias :) I only wanted to say: If the Vic20 and the C64 came out 3 years AFTER the Atari, and best argument is simply that the C64 was (only!) COMPARABLE to the Atari, sounds to me like the Atari had a much more sound design to it. In other words, if Atari had been around for 3 years, you'd think the 'competition' would come out w/ the 'Next Gen' machine...

On a side note, I did come real close to picking up an INFO (or Info 64) mag once, I was interested in buying an ST, and this particular issue compared the ST to the Amiga. Since the magazine was Commodore-centric, they pointed out that if you wanted to get all the capabilities with an ST that you get 'out of the box' with an Amiga, you'd have to buy all this other stuff. And what I noticed was, (and i'm hoping someone remembers this article), if you took away the $500 synthesizer from the ST side, then, for less than the price of an Amiga, you could get an ST with all of these other goodies! :)

Just my two cents! :)

Hmmmmmm... I need to get into my attic to find my receipt... I KNOW the Technical Ref. Notes are dated '82.(I got 'em later -for the schematics - I don't program) .. I'm positive I had my 400 first.. maybe '81? This is becoming a mission... I do know that I have 2 versions of Jawbreaker... the second released under Sierra... I think the first was just Online??? To this day, I still play this game.. the first verions (PacMan type).. my kids like the second (arcade type).... Addictive... Sneakers anyone?!

You can connect up to four floppies, device numbers 8-11 (unless older
1540's and 1541's could only do 8 or 9). There are two traces on the 1541's
PCB that can be cut to address up to four drives.

> Atari's manuals were your standard bit of fluff that was thinner than
> the included catalog of products (some earlier Atari's also came with
> a reasonable BASIC programming manual but contained only passing info
> on Atari's graphics and sound hardware).

Amen to that... After about six months of owning a VIC-20, my parents, at
the suggestion of my elementary school math teacher, bought me an Atari 800XL
and a disk drive. The Atari setup lasted three days because I got frustrated
with it very quickly (I was only 9 years old at the time and knew only a
little bit about BASIC and a tiny bit of ML). The 800XL went back to the
store, and I was happy to go back to my VIC-20 even though it had much less
memory and lower- res graphics. Then my parents gave me a 64 about six months
later which probably made more sense for them financially anyway - I could
keep the 1541 drive and the horrendous 1525 printer that I had been using
with the VIC.

> can easily be moved both horizontally and VERTICALLY. I don't believe
> hardware collision detection is supported. (someone please tell me if
> I'm in error)

Hardware collision detection is supported, but there are some caveats about
it with multicolor sprites (certain bit patterns are interpreted as
"background" by the collision hardware and don't count in the collision).
Also, there is just one register that tells you if a sprite has collided with
another - it doesn't tell you WHICH sprites in particular are overlapping.
For example, the register could report that sprites 0, 1, 6, and 7 are
colliding. But is 0 colliding with 1 and 6 colliding with 7? Or is 0
colliding with 6 and 7 colliding with 1? Or ... (you get the idea).

> one additional problem. For some reason, keboard access on the C-64
> interfered with reading the first joystick one, which effectively made
> a computer with ONE JOYSTICK PORT.

I respectfully disagree. My father and I used to play "One-On-One" (Dr. J & Larry Bird) with both joysticks plugged in and no problems at all. Agreed, however, a programmer had to more careful about reading the joystick port on the 64 than on an Atari. I think both computers are about equal despite my early bad experience with Atari. I continued to read about the Atari 8-bit and ST stuff after the 800XL went back to the store and found it very interesting even though I no longer had one to play with. If my parents had given me the 800XL when I was, say 11 or 12 (by that time I was proficient with Commodore, Apple, and Radio Shaft), I probably would have kept it :-)

Two questions:

1) A bit of an anorak question this, but how many different 810 drive flaps were there? My original (dead) 810 had a square inch or so of metal that swivelled down and pushed the drive mechanism onto the disk. By contrast, one I've recently bought has a button released spring-loaded flap, with enough power to take my finger off. Are these the only two, or were there more?

2) Soon (once my SIO2PC PC is finally sorted out) I'll be looking for ATRs of all my old tape games, which I doubt work anymore. Although there're some old ones like Star Raiders and Lone Raider, which I've seen on the web, most of my collection is comprised of things like Zeppelin's Mission Shark, Fred, and Mercenary. Is there one big site that has squillions of Atari 8-bit games, including the last (trans-disked) tape releases? Failing that, where are the best smaller sites? Also, does anyone have a manual (emailable) for transdisk?

Thanks in advance for any help,

Trystan

There was a third question too:

3) What's the aim of the game in Joust: Do you aim for the jousting
sword/beak thing (to use the technical term) ??

744. FS: New/Sealed Atari 8 Bit Software

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-20 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <IIIp2.9622$7I6.299359@tor-nn1.netcom.ca>
Source record: 56158
Cross-posted to: comp.sys.atari.8bit,rec.games.video.atari

I have several copies of each of the following atari 8 bit software for sale. All items are ne, originally sealed and complete. Orders over $50 receive a 10%
discount. Prices are in US$.

The titles are grouped by publisher:

Software Published by Atari
CXL4013 Asteroids (Cartridge) $7.50
AX2020 Atari Music I (Diskette) $7.50
AX2026 Atari Music II (Diskette) $7.50
RX8064 Ballblazer (Cartridge) $7.50
CXL4020 Centipede (Cartridge) $7.50
RX8104 Crime Buster (Cartridge) $7.50
RX8088 Crossbow (Cartridge) $7.50
RX8083 David's Midnight Magic (Cartridge) $7.50
CXL4025 Defender (Cartridge) $7.50
RX8089 Desert Falcon (Cartridge) $7.50
RX8026 Dig Dug (Cartridge) $7.50
RX8039 Eastern Front 1941 (Cartridge) $7.50
RX8030 E.T. Phone Home! (Cartridge) $7.50
CX421 Family Finances (Diskette) $7.50
RX8067 Final Legacy (Cartridge) $7.50
RX8079 Food Fight (Cartridge) $7.50
RX8029 Football (Cartridge) $7.50
RX8024 Galaxian (Cartridge) $7.50
CX415 Home Filing Manager (Diskette) $7.50
RX8048 Millipede (Cartridge) $7.50
CXL4012 Missile Command (Cartridge) $7.50
RX8052 Moon Patrol (Cartridge) $7.50
CX4007 Music Composer (Cartridge) $7.50
RX8108 Necromancer (Cartridge) $7.50
RX8093 One on One Basketball (Cartridge) $7.50
RX8022 Pole Position (Cartridge) $7.50
CXL4027 Qix (Cartridge) $7.50
RX8063 Rescue on Fractalus (Cartridge) $7.50
RX8033 Robotron: 8024 (Cartridge) $7.50
CXL4008 Space Invaders (Cartridge) $7.50
CXL4011 Star Raiders (Cartridge) $7.50
RX8113 Thunderfox (Cartridge) $7.50
DX5047 Timewise (Diskette) $7.50

Software Published by Coleco
9725 Wargames (Diskette) $7.50

Software Published by Imagic
IZ4203 Atlantis (Cartridge) $7.50
IZ4200 Demon Attack (Cartridge) $7.50

Software Published by Sierravision
SRL307 Crossfire (Cartridge) $4

Software Published by Spinnaker
Aerobics (Diskette) $3
Delta Drawing (Cartridge) $3
Facemaker (Cartridge) $3
Fraction Fever (Cartridge) $3
Snooper Troops (Diskette) $3
Story Machine (Cartridge) $3

Please email offers to rsmith@planeteer.com

Thanks,

Richard.

Heya All,

With much interest I've been lurking this group, and it's only until now that I actually contribute something...

Reading about the classic arguments between the Atari & C64 lovers... Man does this bring back some memories...

ER... But you all will get this a lot, I guess... Every new poster starting to ramble on the good old days, so I'll just skip that and get my own 2pence worth into this discussion.

It's just the fact that whether the C64 or Atari was better (or worse.. whatever).. The C64 users actually improved the machine by abusing those errors... Stuff like FLI and more than 8 sprites and loadsa other stuff were only possible because of an original design flaw of the machine.

No need to tell, that I've enjoyed those bugs (and sometimes still do!)...

Cya'll,
Remi
Tachyon / MEGA - Industries

My original Atari 800XL power supply died after about a year of
purchasing the system new.
>
>Some had failures of other components as well, most noteably the PLA.
>
What's the PLA? Does it stand for Programmed Logic Array. Was it the
chip responsible for joystick/keyboard/serial access? I'm too lazy to
go into the next room to check out my C64 books.

>The standard loading speed on a C64 is anywhere from 2400 BPS to over 25,000
>(25 thousand) BPS.

I find the maximum output of 25,000 bits per second to be highly
unlikely. This would mean a reasonably large C-64 program could
theoretically be loaded in about 15 seconds...a speed comperable to
the Apple II disk drive mechanism. Regardless, whatever speed increase
was accomplished via additions that came out years after the C64's
introduction (I think just a few short months before the C-128's
introduction).

>The Commodore serial bus allows for up to 22 devices. The drives that

How does the HD retain the device number if it's accomplished only in
software?

FD stands for Floppy Drive? HD stands for Hard Drive? What does CMD
stand for?

>
>All of the C64's DOS, Kernal, and disk speed shortcomings are taken care of
>as well shortly after it's release.

Not by Commodore. They did eventually come out with the 1571 drive
which, when combined with the C-128, gave a noticeable improvement in
speed over the older model. Unfortunately, the 1571 connected to a
C-64 did nothing. Regardless, even the 1571/C-128 combo was still
awfully slow compared to even Atari's not-so-fast drives.

I had forgotten to add that one trade-off for the reduced speed was
about 50% increase in storage space over Atari formatted disks. Also,

Atari filenames were limited to a pitiful 8 characters with an
extension of another 3. No computer company would have ever been
stupid enough to repeat that mistake!!! (Wink, wink! Nudge, nudge :-)
)

>
What is FLD and VSP? I'd really like to know about this trickery. I
don't remember this being listed in my books! If I remember correctly,
the VIC's internal addressing scheme was 14 bit and could only access
a 16K bank of the C-64's memory at any moment (a separate hardware
register allowed one to change which 16K bank was accessed). Am I
wrong?

Yes, I'm aware of the the C-64's ability to "simulate" Atari's display
lists via software. I believe I mentioned it in the article. However,
It's much more processor intensive than Atari's method. Also, because
of the C-64's limited display modes, it isn't as important.
>
>The C128 even had a couple of split-screen modes built into it's operating
>system.

Yeah. I completely overlooked the C-128's new and improved BASIC. It
was by far the best version of BASIC ever pre-packaged with an 8-bit
computer. I tried not to discuss the specifics of the C-128/C-128D
because the number of them sold was dwarfed by the various C-64 level
incarnations.
>
>> In comparison to the Atari, the C-64's number of display modes

I'VE NEVER HEARD OF FLI, IFLI, AND UIFLI!!!!! Please, please, please
tell me more (or direct me to a URL that contains the information). I
love to be surprised about the capabilities of old computers.

>LDA $D019 ; Clear interrupt source
>LDA #somerasterline ; Set new interrupt.
>STA $D012

That's 10 wasted machine cycles that the Atari doesn't doesn't need to
throw away. This might not seem like much until one calculates 10 by
the frame rate of 60 hertz for a grand total of 600 wasted machine
cycles per second. If, for some odd reason, one wanted to cause a
raster interrupt on all 200 lines we'd be wasting 120,000 machine
cycles more than the Atari's method. That's a healthy chunk of the
C-64's (roughly) 1,020,000 total cycles per second.

>The hardware will take care of resetting the interrupt to occur at the new
>position.
>
>Display lists, unless handled entirely by the video hardware, are nothing
>unique to the Atari. If the program has toprocess the display list to keep
>it active, then ithas no real advantage.

The whole idea of a Display List is to be hardware based. The overhead
in maintaining Atari's display list is minimal to nonexistent (except
for that irritating ANTIC bug of crossing a 4K boarder via an
unnecessary Load Memory Scan (LMS). Heck I've even set up multiple
display lists to point to each other in order to create full screen
animation without ANY PROCESSOR INTERVENTION!! WOW!! I just got a full
body shiver just thinking about that one.
>
>> graphics modes on the screen) the C-64's only method of mixing display

Pulease....that would waste more processor cycles than setting up a
raster interrupt. Unless you're into politics, POLLING IS NOT AN
OPTION!!

>Most demos use this method, as it requires less overhead than a raster IRQ.
>
>> Atari only allows for half (128). This problems can be circumvented on

>> the Atari by changing the character set pointer in midscreen during a
>> DISPLAY LIST INTERRUPT.
>
>As can the C64.

Because (I believe) of the 16K limitation of the VIC II chip,
character set pointer changes are a bit limited.

>> Judging from the above specs, Atari's are about 60% faster than the

>
>As does the video chip in the C64. Disable it (by turning off the display
>via a register in the VIC) and you get about a 10% increase in speed.

Yes, I was being a bit simplistic in my explanation. The VIC chip does
steal cycles but, compared to the Atari, the amount of cycle
"stealing" between the various display modes is pretty much the same.
Question: Does the processor run at an apparent 1.02 Megahertz before
or after the VIC II chip is turned off? Also, I believe some
telecommunications programs would turn off the VIC II chip when trying
to transfer serial data at the highest possible rate.

>> one additional problem. For some reason, keboard access on the C-64

>Nope, it's just a bug in the C64's stock keyboard read routine.
>
>Any smart programmer knows how to separate keyboard accesses (point shorts
>in the keyboard matrix) from joystick movements (entire rows or columns
>being grounded).

I've always found C-64 keyboard/Joystick access to be very confusing.
It always seemed a bit odd and a waste of processor time (compared to
Atari's and even Apple II's method of reading a single register for
the key press and a separate register for joystick reading.)

>> initializing routiner, would reset all the hardware registers by

>>
>> WINNER: ATARI
>
>Seems to me that in many of the places where you say the Atari is the
>winner, the result is really the opposite or a draw.

Yeah, I know. It's not always easy to separate one's emotional
connection with a computer versus one's intellectual understanding.
However, I still stand by the end results. While typing the original
article I began to remember serious flaws with the Atari ST design
which seemed to be a carry over from the C-64 (after all, Shirav
Shivgi happened to design both computers). Although programmers were
able to eak out quite a bit of performance out of the Atari ST, I've
always felt that it was a has-been from day one (in comparison to the
much more sophisticated Amiga).
>
>You need to double check your facts before you compare two machines. I
>don't know anything about the Atari, so I'll take your word for it that what
>you state is correct.
>
I don't think I did that badly. I believe I have a good basic (albeit
somewhat flawed) understanding of both machines. Admittedly, my
knowledge of the Atari is somewhat greater because I've actually
programmed the thing with both BASIC and MACHINE CODE. I've done very
little of either on the C-64 (although I've spent many hours over the
years pooring through various C-64 programming documentation).

On the level of learning to program graphics hardware, I feel the
Atari is by far the better choice. For understanding how to program
sound, the Commodore 64's SID chip is far-and-away superior (even
though I considered both machine's sound hardware to be a draw). Also,
Atari's operating system is a thing of beauty whereas the C-64's
kernel has a generational, quilt-like feeling similar to, although not
quite as bad as, that of the Apple II computer.

Despite my apparent biases, you must agree that it's interesting how 3
computers (Atari, C64, Apple II) share the same "brain" and yet are
all so very different. It's a tribute to what the human mind is
capable of.

I'm having a problem pinning down the actual year and month of the
C-64's introduction. I just found issue one of Ahoy! magazine dated
January 1984 (by this time the C-64 was quite popular). Give me a
couple days. I may also be able to confirm the exact date of the Atari
800/400 introduction.

Heck. I just remembered that I once got to a web page that broke down
computer and game machine introductions by year. It was very nice.

Despite it's ideosyncracies, the Atari 400 was a capable little
computer which could be upgrade to Atari 800 like capability (unlike
the Vic 20 which was almost entirely incompatible with the C64). Oh, I
believe the Vic 20 came out in 1981. I'll also try to confirm this.

Was the 1525 printer the dot matrix thing with the printout that
looked like a child's rendition of computer printing and a ribbon that
had to be replace every couple of months?

>
>Greg
>
A close friend (he lived just 3 houses from me) liked purchasing
Commodore equipment (first the Vic 20 then the 64) and, based on what
I saw at his house, I almost purchased one in late 1984. Why did I go
for an Atari 800XL instead? When I walked into Child World with cash
in hand I found out the Atari was just marked down to $89.95; a full
$25 less than the C64. Of course, I had to wait six months before I
got a disk drive, which was almost double the price of the CPU!!!!!

: There's a notation for doing just that; I can't do it in ASCII but it's
: putting a double-dot above the last digit of a number. So 2.0-double-dot
: means 2.000000... to infinite precision.

Yes, but you're not choosing a number "at random". The set of numbers
that can be written down in this kind of notation is a small subset of
the real numbers. In fact, the set of numbers that can be written down
is a finite set, because one only has a finite amount of time during which
one can write down the number (one's time on earth is limited; one's
personal end is near), so that only numbers that can be expressed as
having a certain length can be written down--and there are only finitely
many of those. But the probability of picking one number from a finite
set will presumably be non-zero.

Of course, if the universe were to go on forever, and if the basic laws
of nature were indeterministic, one could build a machine that chooses
something that has probability zero: the machine simply chooses a random
digit each second. The number as a whole would then be random.

756. Confirmed Y2K problems with Ataris

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-20 00:00:00 UTC
From: aarona@localnet.com
Message-ID: <36a5b69a.56890739@news.localnet.com>
Source record: 56170

Y2K problems on the Atari? It's loaded with them. Here's a list:

1) Berzerk. When the date reaches 2000 the Robots turn to chickens and run out the exits in mass hysteria. This causes the stick figure with the laser gun to commit suicide and smokes any joystick connected to port 2.

2) Pacman. When the date reaches 2000 a second completely different maze shows up. Unfortunately, none of the dots can be eaten and the game becomes pointless.

3) When the year 2000 rolls around Jack Tramiel will suddenly go on the Larry King show to admit his mistakes of not properly upgrading the Atari 8-bit line to run Win95 via a half mile tall stack of 5 1/4" floppies and that damn PaperClip dongle in the joystick port.

4) When the year 2000 rolls around all the Antic chips in every Atari ever made suddenly metamorphoses into the Amiga's Gary chip and forever displays a GURU MEDITATION ERROR! on the screen.

759. Missing disks

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-20 00:00:00 UTC
From: Eric Sejr Jensen <esjensen@interlog.com>
Message-ID: <7858lh$28m$1@news.interlog.com>
Source record: 56173

Hi,
I recently found this newsgroup and it has inspired me to put my old 800XL system back together. I've got everything going, but unfortunately, most of my floppy disks were chucked out years ago. I simply had too many. :-(

Oh the things I lost - SpartaDOS 3.2D(I found a backup with most of the files), SpartaDOS Toolkit, SpartaDOS Backup (which I believe I used ONCE), BASIC XL Toolkit, BASIC XE Extentsion Disk (fortunately I found the BASICXE.OSS file), MAC/65 Toolkit, Atari DOS 2.0s, Atari DOS 2.5, Atari DOS 3 (well no great loss there), LightSpeed C, Ultima 3, Ultima 4, Autoduel (I love that little screwdriver set it came with), and all my BlackBox utils (I got them back from the CSS BBS). Oh the pain, to read the manuals, and have all the memories flood back. Luckily I still have my SpartaDOS X cart, and R-Time 8 Cart (disk is lost though) so I'm not completely lost. For some odd reason, I also managed to keep a copy of DOS/XL.

I'd like to get back to programming this old baby. My favorite was LightSpeed C. I still have my manual, but the disks are, apparently, landfill. Does anybody still have a copy of it? I think I found a copy of Disk 1 and Disk 2, but I need disk 3 and 4. I believe they had the runtime modules (of course) and the SpartaDOS files.

Does anybody know where I can get these files?

Thanks

Eric Jensen

Actually, the copyright on the inside cover of De Re Atari is 1982,
which may outdate the 400/800 release in 1979, but predate all of
the xl/xe machines and predates the c64 machine. The whole scene
before 1983 was different on many levels. I credit the c64 with
opening up the 8-bit pc market by driving prices down. There were
some premium games avail for 8bit atari before 83, but with the c64
came lower prices and was followed by a software boom for both
platforms. Lets face it, more users (due to lower machine prices)
attracted more programmers.

One last note: The copyright in my copy of VisiCalc for Atari 800
is 1981.

>Well and good, but isn't it still the case that De Re Atari post-dates the
>release of the machine significantly? The Commodore Programmer's
>Reference Guide doesn't, that much I know for absolute certain.

Hola Vidar,

You're opening up a can of worms here :)

In article <01be4326$0a91d420$5b364382@vidar>,
Vidar \"Hawk\" Olavesen <olavese@online.no> wrote:
>> > I do think the Atari has a little more speed to boost. I coded some
>demos on
>> > the Atari and still haven't seen any on the C64 which uses the machine.
>My
>> > friend is totally awestruck by the C64 sound, but the colours on the
>Atari
>> > is a big plus.

re: colors. Remember that while the Atari has a large palette, the screen
colors are fetched from registers. Compare with the 64, which has
a smaller palette, but fetches colors from RAM. Thus while the
Atari has more colors, the 64 is in general more colorful.

>like to see. I do like the C64 more now than I did then, but I still keep
>the edge on the Atari.

I do think it's worth mentioning that there are programs other than
demos, and these programs are really what sell a computer -- to wit,
games and application software. I would claim that color RAM, sprites,
custom characters, and good sound are very valuable to the former,
and that simple things such as hardware timers are very valuable
to the latter.

Toss in a full 64K of RAM and decent hardware expansion ports and
you've got a winner; stick a decent price tag on it, and suddenly
it's pretty easy to see why the 64 was so dominant. While I like
the Atari, I of course give more than an edge to the 64.

-Steve

> theoretically be loaded in about 15 seconds...a speed comperable to
> the Apple II disk drive mechanism.

202 blocks loaded in six seconds, including the drive's getting the head ready, under an Action Replay 6 or the external strip a hacker did of it's fastloader. The AR claims 25X stock speed and JiffyDOS and DolphinDOS are both faster.

> Regardless, whatever speed increase was accomplished via additions
> that came out years after the C64's introduction (I think just a few
> short months before the C-128's introduction).

Software fastloads were around in 1983 that could manage about 10X to 15X standard speed. The bad memories most people have of long loads are due to programmer negligence in not using a speeder.

Nate:
> Older 1541's had two jumpers inside the drive which could be cut to
> change the device number. The default is device #8.

Aaron:
> ...and the second would be device 9. Correct?

Yup, and the third and fourth were 10 and 11. Tape was 1 and the printer normally 4.

> FD stands for Floppy Drive? HD stands for Hard Drive? What does CMD
> stand for?

Yes, yes and because someone stole their seats. Err, no CMD is Creative Micro Designs, who still sell C= equipment and software. They manufacture C64 hard drives and 3.5" floppy drives, as well as doing a load of other products.

> I think, with the above info, you've confirmed what I said. Commodore
> DOS was absolutely arcane.

Depends on your idea of arcane, if you don't know what "dir" means you're not going anywhere fast and if you don't know, for example, that the Amstrad CPC uses "cat" instead... I'm used to hitting F3 for a directory, or typing LOAD"$",8 if I haven't got an Action Replay (a *rare* occurrence).

Aaron:
> Please bear in mind that Atari's DOS is in no way perfect. I could

^^^^^ ^^^^^^^^^^^^^^

Nate:
> All of the C64's DOS, Kernal, and disk speed shortcomings are taken
> care of as well shortly after it's release.

Aaron:
> Not by Commodore.

Best read what you said above, Aaron.

Nate:
> The C64's limit was destroyed with the advent of FLI, IFLI, UIFLI and
> other extended graphics modes.

Aaron:
> FLI, IFLI, UIFLI?????? What do these mean?

All three are generated using bugs in the vertical smooth-scroll
register $D011 and increase the colour resolution and, apart from FLI,
the screen resolution above the standard hardware specs. None are
documented features of the chip.

Nate:
> Unless you use FLD or VSP, tricks which cause the VIC chip to move the
> screen for you an unlimited distance either vertically or
> horizontally.

Aaron:
> What is FLD and VSP?

Flexible Line Distancing and Variable Screen Positioning. The former
can push an entire 10,000 byte bitmap downwards by 1 to 200 pixels, the
latter can move the screen horizontally by up to 320 pixels. Both are
more bugs with $D011 and undocumented.

Nate made a slight slip with his description, the trick to move an
unlimited distance horizontally is a variant of VSP called LineCrunching
(sometimes called a "wanker" routine by the European coders, for reasons
I've not managed to get out of 'em yet... =-) but is again a $D011 bug
and again undocumented.

> I'd really like to know about this trickery. I don't remember this
> being listed in my books!

They won't be, along with upper and lower borders, sideborders, Half
FLI, AHires and a load of other stuff. The C64 coders invented all
these modes using what Commodore supplied and making do what it
shouldn't. And, as someone who has done most of the above, they're a
bugger to do an' all, and that's half the fun of it. =-)

> If I remember correctly, the VIC's internal addressing scheme was 14
> bit and could only access a 16K bank of the C-64's memory at any
> moment (a separate hardware register allowed one to change which 16K
> bank was accessed). Am I wrong?

No, that's right. But you could change that bank on every rasterline.
With FLIP (a variant on FLI) it's possible to split where the C64 is
getting it's character and screen data from on every rasterline from
almost anywhere in the memory.

> Yes, I'm aware of the the C-64's ability to "simulate" Atari's display
> lists via software. I believe I mentioned it in the article. However,
> It's much more processor intensive than Atari's method. Also, because
> of the C-64's limited display modes, it isn't as important.

Nope, we all live in raster interrupts, believe me. The extended modes
Nate listed all rely on them, as do the border tricks and a load of
other stuff. 'Sides which, how else do you get away with loading at the
same time as running an effect...? =-)

Nate:
> It takes two lines (5 bytes) of code to move the raster interrupt
> position around on screen:

> LDA $D019 ; Clear interrupt source
> LDA #somerasterline ; Set new interrupt.
> STA $D012

Aaron:
> If, for some odd reason, one wanted to cause a raster interrupt on all
> 200 lines we'd be wasting 120,000 machine cycles more than the Atari's
> method. That's a healthy chunk of the C-64's (roughly) 1,020,000 total
> cycles per second.

You don't do it that way, you just wait for the raster to kick in at the
top and lock the interrupt into a loop until you're done. Take the
ESCOS routines for example.

ESCOS is the 1001 Crew's Expanded Screen COnstruction System, it uses 56
horizontally and vertically expanded sprites to fill the entire screen,
including all four borders. Sideborders on the C64 is a *very*
processor intensive job (and a git to time as well) and every rasterline
that you want open has to perform some trickery to use a bug in $D016
(horizontal smooth-scroll and, surprise surprise, not documented) and
ESCOS runs for just under 300 lines.

Of course, at 300 lines, it's a PAL routine, BTW... =-)

Nate:
> Or one can use the tried and true method of waiting for the desired

> OPTION!!

It can and *has* been done and it's more efficient than you seem to
think. I actually tend towards doing the equivilent on a raster,
trigger the first position and wait for various others down the frame.
Means my runtime code is normally a JMP back to itself...

> Because (I believe) of the 16K limitation of the VIC II chip,
> character set pointer changes are a bit limited.

There is room for seven character sets in bank 1 and bank 3 (allowing
for a screen in there too, of course) and you would only need five to
fill an entire screen with different character definitions. Not a
problem.

> Yes, I was being a bit simplistic in my explanation. The VIC chip does
> steal cycles but, compared to the Atari, the amount of cycle
> "stealing" between the various display modes is pretty much the same.

The extended modes that Nate has mentioned produce much higher VIC-II
overheads, FLI and it's variants force the VIC-II to produce more "bad"
lines, so instead of one in every eight rasterlines stealing some CPU
time, they all do it.

I believe you are perhaps missing the bigger picture here: it is the
Atari people that are saying that the 64 is comparable to the Atari.
This quite a step up from the "Atari, designed by deities and known
only to a chosen few, was overwhelmingly superior to the 64 which only
sold well due to cheapness and C= 'dirty tricks'" argument of a year ago.

In fact, it seems to me that if _Atari_ people think it is comparable,
then it must indeed be quite markedly superior!

>don't really seem to be all that much... I was fond of the Atari and if

Well, spec sheets can be quite deceptive. The Apple II had something
which neither the Atari nor 64 had: slots. Not only could you add
all kind of graphics and sound cards, I recall things like 286 boards
and IBM emulators, when I was in high school! Add in a decent BASIC,
a built-in monitor, and a whole lot of software, and it's an OK
machine.

It also had one other thing Atari and 64 never had: support!
The downside of this is that Apple 8-bit people got so dependent
on Apple that they have forgotten how to "fend for themselves"
(at least, this is my impression) -- now that Apple is no longer
supporting them, the 8-bit people seem in trouble.

Hmmmm, seems to me that an argument of a year ago was that the Atari
had such a great OS that you never had to modify it or know how it
worked.

Besides, disassembling code is pretty easy. When did Atari release
detailed hardware descriptions, though? That is, the graphics hardware
specs, how to access the graphics -- descriptions of each bit of
every hardware register byte? Did Atari _ever_ release this info?

In article <JATICHANUP@cabal.shnet.org>,
Thorsten Guenther <guenther@cabal.shnet.org> wrote:
>
>The Ataris' processor speed was 1.79 MHz, and the 6502C was "C"o-opera-
>ting with the ANTIC graphics processor (that was able to halt the CPU).

To be fair, it is worth pointing out just how often ANTIC halts the
CPU. A PAL 64 loses 1000 cycles every frame, giving 18656 free cycles
per frame. By contrast, a plain jane gr0 screen loses 11288 cycles
per frame, giving 24180 free cycles/frame -- a speed difference of
about 1.29 times. Thus while the Atari is noticably faster, it's not
1.8x faster. (Hires graphics do better than 1.29x, too).

Obviously, if a program can take advantage of hardware features
(e.g. sprites) it will gain a significant speed boost.

>Additionally, the Atari had many video modes requiring 4K or less, the

Honestly now, how many (non-demo) progams ever use those modes?

The 64 needs 1k for a character graphics screen, and that's it.
(Color RAM is separate from system RAM, and may be switched out, hence
I see no reason to include it).

>C=64 apparently lacked such modes. I have only been told by (former)
>C=64 users that "Rescue on Fractalus"' speed sucked - and I guess the
>above clarifies why.

Rescue is indeed somewhat lousy on the 64, but that is a tribute to
the programmers, not the machine. All things being equal the
Atari would undoubtably be faster, but there is some rather lame
coding in the 64 version.

Put it this way: I bet my 64 3D programs are faster than a lot of
Atari 3D programs. But that doesn't mean the 64 is faster.

>Yup, bot OTOH the POKEY had also some nice features. Apparently it was
>harder to program than the SID, but e.g. Rob Hubbard's "Warhawk" sound
>track sounds better on POKEY than on SID.

SID is really rather sophisticated -- each voice can have four waveforms,
an ASDR envelope, filters, different pulse widths, and so on.

>The sprites _were_ far better than the Player/Missile concept. I guess

Indeed.

> What's the PLA? Does it stand for Programmed Logic Array. Was it the
> chip responsible for joystick/keyboard/serial access? I'm too lazy to

The PLA is responsible for I/O device address decoding primarily. In other words, it's what gives the CPU access to the SID, VIC, CIA's, and whatever is attached to the expansion port.

It also controls things like ROM mapping on the expansion port.

If that chip goes, the computer will be paralysed. It's functionally equivalent to a person being rendered quadrapalegic (sp?) - he can think and see and hear, but he can't move, and in some cases, he can't even talk :(

> >The standard loading speed on a C64 is anywhere from 2400 BPS to over 25,000
> >(25 thousand) BPS.
>
> I find the maximum output of 25,000 bits per second to be highly
> unlikely. This would mean a reasonably large C-64 program could
> theoretically be loaded in about 15 seconds...a speed comperable to

The best fastloaders (which are entirely software based) can load a 50KB program in about 9-10 seconds.

This equates to around 5 KB/sec, which is about 40,000 bits/sec - far faster than the average speed :-)

> the Apple II disk drive mechanism. Regardless, whatever speed increase
> was accomplished via additions that came out years after the C64's
> introduction (I think just a few short months before the C-128's
> introduction).

Only because theprogrammers took that long to come up with fast routines. As I said, any dusty old C64 built in early 1982 can do these kinds of speeds, using a plain old 1541 drive and absolutely no hardware hacking (you either plug in a cartridge or load your fastloader from disk).

In comparison, the C64's tape has been sped up to around 10x it's original 300 bps speed - about that of a stock 1541. The average game under such a fastloader would take 3-4 minutes to load, versus 30+ minutes when loading without a fastloader.

> ...and the second would be device 9. Correct?

Correct, hence LOAD"filename",9

Following that were 10 and 11, and so on up to device #30. I recommend avoiding device #30, since the CMD HD uses that device # temporarily when it

is in Install or Configuration mode.

> I was aware of that...which is why I specified "older drives."

My fault - I didn't notice the "older drives" qualifier.

> How does the HD retain the device number if it's accomplished only in
> software?

It stores it on the HD mechanism along with the rest of it's DOS.

The CMD HD's DOS can be permanently upgraded by simply running a program, and the device number is saved into that area as well as other things such as the default partition to open on powerup.

> FD stands for Floppy Drive? HD stands for Hard Drive? What does CMD
> stand for?

CMD = Creative Micro Designs

The FD, for what it's worth, is a 1.6MB high-density 3.5" floppy drive - takes standard HD 3.5" disks and formats them for use on a C64. It can also read, write, and format 720KB or 1.44MB PC disks using software lik Big Blue Reader or Little Red Reader.

> I think, with the above info, you've confirmed what I said. Commodore
> DOS was absolutely arcane.

Oh yeah, the actual DOS is pretty wierd if you're not familiar with it, but after you learn it, it is quite straightforward.

```
OPEN 1,8,15 <--- open a channel to the disk drive command interpreter
PRINT #1,"some command"
CLOSE 1
```

Or with a standard DOS extantion, simply type @some command without the OPEN/PRINT/CLOSE fluff.

It's not so much that the DOS itself is arcane, but rather the way in which you access it.

Command N means "new disk". S means Scratch (delete). C means copy (a file), V means validate (rebuild Block Availability Map).

The digit "0" and a colon usually follow the command letter, mostly out of force of habit from using the older dual-drive systems. It also avoids potential bugs that exist in the old 1541 DOS.

Following the colon will be one or more filenames (for scratching/deleting), or a disk name and two-character ID code (for New disk (format)).

> Not by Commodore. They did eventually come out with the 1571 drive
> which, when combined with the C-128, gave a noticeable improvement in
> speed over the older model. Unfortunately, the 1571 connected to a

As I said, Commodore themselves released the DOS extension, DOS 5.1, with the 1541 drive.

It came on the Test/Demo disk that was shipped with every new drive Commodore made, even the 1571 and 1581's.

The fac that they Didn't just burn it into a ROM does puzzle me, though.

> C-64 did nothing. Regardless, even the 1571/C-128 combo was still
> awfully slow compared to even Atari's not-so-fast drives.

Well the 1571 does nothing for the C128 itself anyways - The C128's fast serial works with 1571, 1581, and CMD devices

When combined and used properly, the C128 is capable of fairly fast speeds.

Desterm 2.00, for example, can be booted from a 1571 disk in about 20 seconds - that program is pretty large, and has many moduls that it has to load.

The trick is knowing how to save the file to the disk properly - By using correct sector interleaving, you can increase the speed. This isn't a hardware hack, and programs saved with modified interleaves are perfectly fine under standard C64 DOS.

> extension of another 3. No computer company would have ever been
> stupid enough to repeat that mistake!!! (Wink, wink! Nudge, nudge :-)

hehe

> How can the output be only 8-bits if the frequency facility was
> 16-bit? It doesn't make sense.

I use the term "resolution" and "sample rate" in the same way with analog as I do with a digital waveform such as a *.WAV file.

Resolution refers to the height of the waveform, and in particular the number of steps from 0 (or minimum voltage) to maximum.

Sample Rate refers to the number of times per second that the output is calculated and updated. In he case of the SID chip, thatis 1 Mhz - a bit over 1 million updates per second.

I suspect the "Pokey" chip has a similar effective sample rate.

And now that I think about it, I made an error - the full 24-bit resolution of each voice makes it to the output of the SID.

The 8-bit resolution was just an oversight - I was thinking of the Waveform and Envelope output registers for voice 3 - those allow a program to read the upper 8-bits of these twqwo functions on voice 3. Normally this is used for FM effects (like vibrato or ring modulation) and random numbers (by using the noise waveform).

In addition, each voice may be used to generate up to a 4 KHz sample rate 8-bit digital waveform. You can combine two voices to extend the sample rate to about 64 Khz. I don't know offhand what three voices can do when

ganged together.

Higher samaple rates on single voices are possible but the SID will lose resolution - effectively 1 bit for every 2x increase in rate (so 8 Khz yields about 7-bits, 16 Khz would be about 6-bits, and so on).

Combining voices together properly can alleviate much of this problem.

> FLI, IFLI, UIFLI?????? What do these mean?

FLI means FLexible Line Interpretation. In a nutshell, it provides a 160x200 screen with 16 colors. Color Data is interpreted in three ways. One is the background color, which is usually common to the entire screen. The second is standard color memory, which forms a 40x25 matrix of color cells, each specifying one color. Third is the 40x200 matrix of color cells, each cell of which may specify two more colors.

IFLI is the Interlaced version of the above. Put simply, two standard FLI screens, interlaced, with alternating fields offset by 1 pixel in the horizontal. The effect is 320x200 with 136 colors (of which about 55 are flicker-free). In some applications, the 40x25 color cell map as specified above can also be interlaced, while in others, both fields get thier 40x25 color map data from the same area of memory.

UIFLI is basically IFLI with two full-screen layers of X-expanded sprites. That is, each 160x200 field has a 160x200 layer of sprite data along with it, data which I believe can have 1 color per 48x2 area (really 24x2 but the hardware has doubled the widths of the sprites). There are two such 160x200 fields (and thus two 160x200 sprite layers) which are interlaced in the same way as the standard IFLI mode.

On accellerated machines, it is also possible to change the background color on every raster line, and change the sprite colors as well, giving the sprite maps a 48x1 color resoultion, and the background a 320x1 resolution.

There are other formats as well, such as MCMLace, Drazlace, HiFLI, and so on, which are variations on the above modes, using various types of standard displays. Some are interlaced, others are not.

> I was certain about 24 (exactly 3 bytes) across but wasn't exactly
> sure of the vertical amount.

The 24x21 matrix yields 63 bytes, and the actual sprite mapping calls for 64-byte wide segments. The 64th byte is useful for storing the sprite's color and a few flags such as X expand and Y expand, and perhaps whether or not the sprite should be considered when checking for sprite-to-background-data and sprite-to-sprite collisions.

> >Unless you use FLD or VSP, tricks which cause the VIC chip to move the
> >screen for you an unlimited distance either vertically or horizontally.
> >
> What is FLD and VSP? I'd really like to know about this trickery. I

These are more new tricks invented by programmers.

FLD means Flexible Line Displacement, and allows one to use the VIC to scroll an entire bitmapped display (even FLI/IFLI modes can be done) using only a minimal amount of processor overhead.

VSP is Variable Screen Positioning, and can move up and down (a raster at a time), or sideways (by a whole byte). Combined with the standard scrolling registers, one can scroll an entire display using very little processor time.

Smart coders (of which I am not :-) can do all kinds of calculations and such during FLD and VSP time, as they tend to tie up theprocessor in a wait loop. No prob, just do some calculations, and time them out properly with a few NOP commands or whatevr if needed, so that the FLD or VSP effect is still being done.

> a 16K bank of the C-64's memory at any moment (a separate hardware
> register allowed one to change which 16K bank was accessed). Am I
> wrong?

You are correct, the VIC has access to only 16 KB at any one time. Modes like IFLI and UIFLI change the 16KB bank register between fields, giving the illusion of 32K of address space.

> Yes, I'm aware of the the C-64's ability to "simulate" Atari's display
> lists via software. I believe I mentioned it in the article. However,
> It's much more processor intensive than Atari's method. Also, because
> of the C-64's limited display modes, it isn't as important.

Perhaps so, however intelligent programs know how to split the screen (even once per raster line if desired) and still accomplish a full regimen of functions at the same time.

It may be a little more involved to program, but that's strictly a matter of convenience. IF the programmer can accomplish with software what another machine uses hardware for, without losing a significant portion of the CPU in doing so, then the point becomes moot anyways.

> Yeah. I completely overlooked the C-128's new and improved BASIC. It
> was by far the best version of BASIC ever pre-packaged with an 8-bit

Agreed. However you are right - this is a C64 vs. Atari discussion, and as such C128 functions have no real bearing anyways.

> computer. I tried not to discuss the specifics of the C-128/C-128D
> because the number of them sold was dwarfed by the various C-64 level
> incarnations.

I never understood ewhy either - overall the C128 is a much more capable machine. It was probably just the cost of the machine, and the fact that it had a full C64 compatibility mode (minus one or two hardware-unfriendly programs, like with the Atari's later machines). That full C64 mode meant coding games/tools strictly for the C128 would have yielded less revenue.

Commodore's crap marketing didn't help the C128 either.

> I'VE NEVER HEARD OF FLI, IFLI, AND UIFLI!!!!! Please, please, please
> tell me more (or direct me to a URL that contains the information). I
> love to be surprised about the capabilities of old computers.

Hehe, described above.

ftp.funet.fi and ftp.scs-trc.net are two good places to find software that works in these modes. Look for the various editor packages. I recommend the UIFLI editor produced by Crest (a well-known demo group). It comes with the absolute best ever C64 graphic image, called "Multimediot", drawn by the one and only DeeKay.

The display quality and total amount of color resolution shown should knock you right off your chair. It just doesn't get any better than this without an accellerator.

The editor (and most of the various other ones out there) is/are available in both PAL and NTSC versions.

> >LDA $D019 ; Clear interrupt source
> >LDA #somerasterline ; Set new interrupt.
> >STA $D012
>
> That's 10 wasted machine cycles that the Atari doesn't doesn't need to

True.

> The whole idea of a Display List is to be hardware based. The overhead
> in maintaining Atari's display list is minimal to nonexistent (except

I see.

> Pulease....that would waste more processor cycles than setting up a
> raster interrupt. Unless you're into politics, POLLING IS NOT AN
> OPTION!!

Well, as I said the average VIC programmer does various kinds of calculations during that wait time. Good programmers can fill the entire 63-cycle line with code, leaving just enough time to update various registers for the next line.

> Because (I believe) of the 16K limitation of the VIC II chip,
> character set pointer changes are a bit limited.

Yes, they are. Good programmers know how to change VIC banks mid-screen, to increase the VIC's memory range.

With the right combination of register changes, one can give the illusion of a full 64KB access range (Normall the graphics modes I mention give the illusion of 32K of addressing).

> Question: Does the processor run at an apparent 1.02 Megahertz before
> or after the VIC II chip is turned off? Also, I believe some

Before. And actually, 1.02 Mhz is the hardware clock itself. As such, turning the screen off gives the entoire 1.02 Mhz clock to the CPU.

With it turned on, the VIC chip steals 43*25 cycles per frame, which amounts to around 10% of the CPU's time, by placing the 6502 in a "wait state".

> telecommunications programs would turn off the VIC II chip when trying
> to transfer serial data at the highest possible rate.

So do, yes. But with proper code and a decent UART chip (which come on cartridge, as with the SwiftLink and Turbo232), one can blast data to theport at a full 57600 BPS, with the screen turned on.

> I've always found C-64 keyboard/Joystick access to be very confusing.
> It always seemed a bit odd and a waste of processor time (compared to
> Atari's and even Apple II's method of reading a single register for
> the key press and a separate register for joystick reading.)

It saved money back then, by using the same register for two different functions and relying on the software to be able toproperly decode keyboard and joystick accesses.

> Yeah, I know. It's not always easy to separate one's emotional
> connection with a computer versus one's intellectual understanding.

Indeed. It really pays off (in terms of what a person thinks of you) when you know first hand what a machine is really capable of.

> I don't think I did that badly. I believe I have a good basic (albeit
> somewhat flawed) understanding of both machines. Admittedly, my

Indeed, you were close, but at the same time you left wuite a bit out :-)

> Atari's operating system is a thing of beauty whereas the C-64's
> kernel has a generational, quilt-like feeling similar to, although not
> quite as bad as, that of the Apple II computer.

Actually, the C64's operating system was derivied from many of the older PET computers. Personally, I think the C64's firmware (and maybe the disk access system) should have been completely and totally rewritten. It would have been far better to drop the idea of VIC-20 compatibility (which is why, for example, the C64 continued to use the old Serial bus, once they switched to using it in the VIC-20).

Commodore should have designed better peripjherals that used parallel instead of serial access, and firmware that didn't give a shit about older hardware :-)

Someone would have eventually made an adaptor to connect otherwise incompatible hardware, to serve the market for those who didn7t want to throw away thier old peripherals (hence, we have things like IEEE interfaces to connect old PET drives to the C64)

> Despite my apparent biases, you must agree that it's interesting how 3
> computers (Atari, C64, Apple II) share the same "brain" and yet are all
> so very different. It's a tribute to what the human mind is capable of.

Indeed. In many cases, it comes down to what the hardware is capable of when wrapped around the same 6502 core - Apple had expandability, Atari had

the faster clock speed, the C64 had the superior video/audio hardware.

Each has it's uses and eash was aimed at a different audience.

That's all find and dandy but, you know why Apple was cheaper than
Atari? Because it's graphics SUCK and it was somewhat hard to program.
The Apple II by itself was pretty weak as far as graphics. However,
everything else in that damn machine was pretty powerful when they
started coming out w/ the 256K models.

Laters,

The Atari was the only one capable of freely mixing Analog and digital
data on the same cassette tape via program control. (ie. in the case
of a foreign language program, a segment of computer code containing a
foreign language test would load up and then the newly running code
would proceed to play the next section of tape that contained analog
voices..through the TV or monitor speakers.)

> Why the XF551 is damned hot!
Mathy,
The XF551 mechanic runs at 12VDC, while the electronix uses 5VDC. The
XF551 has approx. 15VDC right after the rectifier, which must be dropped
to 12VDC and 5VDC. In case of the 12VDC, you only have to drop 3V, but
looking at the 5V, you've to drop 10V, and this 10V will all be tranformed
into heat...

This is also true for the 1050, but this one has less things running at
5V, and has more power-regulators, which reduces the heat a bit...

I know you are using a Black-Box, so I guess you also have a PC-type
powersupply, so why not mount an extra input on the XF551 to run from +5V
and +12V, so you don't have to use the power-regulators inside the XF551 ?

> Maybe completely foolished / use Atari every day
Andreas,
Not at all! I know there are still people like us, still using the Atari 8-bits. It's a pitty we don't read from them very much, but not all Atari-owners do own a PC or something to acces the internet.

> Games

I don't play games on Atari 8-bit very often, but if I do, I like ZADOR2, Missle-Command, or DynaKillers! TekBlast is also great.

> Better graphix, then use Jaguar

I have one, so I do. I like DOOM, even it's outdated. Also Alien vs Predator seems to be a good game, but I haven't played that much since I don't have it that long. I bought it at the last ABBUC JHV (hmm, bad statement I guess, buying a 64bit game bit on an 8-bit meeting :-))

> Pirated games

Well, if the game is not available anymore, how will I ever get it if I don't have acces to the internet ? Or someone had to "buy" the copyrights and release it again, or better, release it as Public-Domain, like you do!

Sysop Fox-1 (fox-1 AT aq DOT nl)

p.s. Text-processing is o.k. on Atari 8-Bit. I don't use my Pentium for this. Atari-Writer+ or Panther 1.0 are great word-processors, so why would I change to another platform for this task ? Never had the luck to word-processing on a Jaguar anyway, which is a 64-bit system :-))

> Atari: Lack of software, not using machine capacity
You're kidding, don't you ???

There is way enough software for the Atari 8-bitters. It's sometimes a bit hard to obtain, but everything is available somewhere...

More titles on a platform doesn't have to mean "different" titles, like, what do you want to do with 67 different (actually nearly the same) versions of Pac-Man ?

Atari-coders are not using the capacities of the Atari ? In my opinion, there are no coders using the capacity of a computer more, then most Atari 8-Bit coders do...

Have you ever tried the "DynaKillers" game from GMG ? Or the more recent game from Sikor Soft named "TekBlast" ?
Or some older games like Trix, Drop-It, Misja, Brundles, etc... ?

If you did, what do you think of these games ?

Excellent condition Atari 800 console and Atari 810 disk drive with printer and Super Sketch graphics pad

-Cables/switchbox/power supply included

-2 Joysticks

-Parallel Port Interface with Okidata Microline 82A Dot Matrix Printer (Did not try this setup, but should work)

-9 boxes of 5.25 inch games/utilities. All together there is over 100 homemade 5.25 inch disks with 2-4 games on each disk!

2 "copy-paper" boxes full of boxed games/utilities and documentation. They are too numerous to list all, but there is Music Painter, Mickey in the Great Outdoors, Various Programming, Basketball, childrens educational. This is only a few of them!

Here is the description for the Super Sketch:
Super Sketch provides a totally unique and simple medium for creating video graphics. As the stylus is moved across the pad, an image is created on your computer screen. Four push buttons at the top of the controller pad control the color selection and graphics functions of the stylus. Graphics may be "free-handed" or "traced" onto your computer.

This system plays all Atari 800 disks and cartridges. Everything works, but I did not try the printer. There is no way that I have the time to try out all the games, but out of the ones I tried they all worked. Montior not included. Can work on a regular TV.

Make me an offer!!

I can send a picture off all of it if you request!

Shipping will be a lot because there is a lot of stuff here!!

Erm! Granted Encounter appeared on the Atari a while before the c64
version as Paul Woakes was originally an 8 Bit Atari programmer, but
Mercenary ' Escape from Targ' was in development for what seemed a
very long time and the potential market of a sole Atari version was
far too small to pay for the development costs. When Mercenary was
finally unleashed it was virtually a simultaneous release on both
platforms as I recall. Paul Woakes was a bloody genius, it was the
fastest wireframe graphic game on either computer - but the speed was
thanks to maths rather than the dedicated graphics chips of either
computer hence the code was NOT really platform dependant as with
most other games of the era. In fact the only descernable difference
was the different messages you received if you shot a commodore or an
atari billboard. Unfortunately, Novagen was effectively a one
programmer outfit and it was the fact that this programmer was a
perfectionist that Novagen finally went to the wall :-((((

Some of these graphics (gfx) modes, including FLI, are explained here:

http://www.geocities.com/SoHo/Studios/6463/gfxmodes.htm

Have a look around while you're there - there are some examples on other pages of this site that show some of the results of these gfx modes. In particular, have a look at the page relating to the Krestology demo by Crest.
(http://www.geocities.com/SoHo/Studios/6463/gfxmodes.htm)

> What is FLD and VSP? I'd really like to know about this trickery. I
> don't remember this being listed in my books!

FLD is Flexible Line Distance, and VSP is...something I'll let someone else answer (Vertical Scroll...?). If you are interested, though, get hold of the CCS64 emulator and look at the game "Mayhem in Monsterland" (1993). It uses VSP and because of that can't be run on just any emulator.

Also, FD = floppy drive, HD = hard drive, and CMD is not a drive, but a company (Creative Micro Designs) that is still making C64 products including a super-CPU add on, hard drives, etc.

http://www.cmdweb.com/

Regards,

Andrew.

Isn't this a bit of a non-argument? There *were* more C64 users than there *are* playstation users at one point in history, but time moves on. No? It doesn't mean that for over a decade (1982 - 199x) the Commodore64 was an *awesome* machine which had some killer demo concepts hacked on its hardware... much like on Net Yaroze today.

>Since we are comparing Coms w/ Ataris, how would the PET and the Atari
>400 compare w/ each other?
>
As far as I'm concerned, The PET and Atari 400 are two entirely
different animals. The PET was a business computer with a very, very
good keyboard and editing functions but absolutely no bitmapped
graphics or sound support whereas the Atari 400 was essentially a low
cost computer (or expensive game machine, depending on how you look at
it) with a god awful keyboard.

Perhaps next time we should compare Stephen Hawking to Karem Abdul
Jabarr!!???

Apple II style computers were an odd bunch. In many ways they were
very primitive in comparison to the Ataris and Commodores. But it
should be understood that the beginnings of the Apple line predates
even the Atari by at least 2 years. Also, unlike Atari and, to a
somewhat lesser extent, Commodore, Apple actually UPGRADED the line
over the years. (anyone remembe the wonderful Apple IIGS, with its
all-new graphics and sound hardware and graphical "Mac like" OS or the
AppleIIC Plus with a 4 Mhz 6502 in an Apple IIc style "portable" case
and without the necessity for a "brick" power supply?)

No matter how much I look down on the Apples over my beloved Ataris, I
must say that the Apple was THE HACKER'S PARADISE (in terms of both
hardware and software). Apple computers had the absolute best 3rd
party programming & hardware fiddling books. In fact, my favorite
programming manual was called ASSEMBLY LINE for the Apple.

Has anyone ever studied the Apple II series memory map? It's
absolutely Byzantine, with sections of DOS code spread over a
multitude of RAM "segments"? Or, maybe, the nonlinear RAM layout of
grapics memory that required a lookup table just to support it? (not
to mention the 8th bit of every screen byte being used for a second
color palette and not an extra pixel). Oh, and then there's the color
burst signal that allowed one to see color but made text absolutely
unreadable? And then there's the SLOT problem where certain cards had
to be placed in certain slots before most software would recognize it
(a problem that, luckily, the IBM doesn't have)?

:-D Yes, that was the printer. I did a couple of reports in elementary school that thing, and one of my teachers asked me if I had forgotten to set the thing to lower case because the g's and q's did not descend below the line properly. It was also the noisiest dot matrix printer I have ever heard.

That might have been another reason why my parents gave me an 800XL at first - it was at least a year later before they got me the 64 after the 800XL went back to the store, so they were probably waiting for the prices to come down. :-) Yep, I remember when disk drives were that expensive! I have the premier issue of Computer!'s Gazette, and 1541 disk drives were selling in there for about $350 compared to $150-$200 for a VIC-20. Even a datasette would have set you back $60-$80 then.

Apple was cheaper than Atari? My recollection is that the Apples were ridiculously expensive. In fact, that's the sole reason I started on the Commodore rather than the computer I first learned on (the old black Apple II+). Turned out to a be a good decision in many ways, but it was really just due to price.
And Apple's BASIC was good, better than Commodore's anyway. No poking necessary. Where Apple fell down and Commodore excelled was onscreen editing. Apple's graphics did suck, but what was worse (a thousand-fold) was the so-called 'sound' the Apple produced. Total joke.

Jason,
Thanks, I got the sources, but all I can figure is the order of the registers. I 'm not sure if I'm correct or not, or where they would be located in memory.

Are they starting at $A000 (left cart?) and extending to $A010? 16 locations with only the first 8 or so used?

I guess some hard and fast facts from the DOS gurus that check for a clock for time stamping would be even more helpful.

Anyone?

tony

Hey guys, you just bolstered my argument that Atari could have blown Apple out of the schools if it chose to do so! After all, what do kids need?

1. Assuming that the big push for programming in BASIC was still there in schools, the screen editor on Ataris and Commodores alone would have made Apple][s look weak.

2. Sound and graphics, sound and graphics, sound and graphics! If you want to grab kids and hold them, these are the elements you need!

However, I've seen Commodores in schools. They just didn't stand up mechanically witht the punishment that kids gave them. My school system (NYC Board of Ed.) never went in for Atari to any extent. But those schools that do have them report that while they still operate, they can't use them. System policy is that a school can't sell what they don't use. They must send it to another facility within the system. I guess those few Ataris (mostly 600XLs) are still making the rounds.

I was a teacher of the homebound for many years. At one point, I was issued an Apple //c to drag around with me. We did some programming on it, used it to teach applications (AppleWorks,) and broke the social isolation of homebound youngsters. They could send messages to each other in a section of the Board's BBS that was moderated by one of our guidance counselors. I got to know the day-to-day workings of the //c fairly well, but I'd never tell a student to go out and buy one.

795. Atari 800XL keyboard question

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-21 00:00:00 UTC
From: John Marks <marks7@flinet.com>
Message-ID: <36A6F243.7D63@flinet.com>
Source record: 56005

Hello,
I am new to this newsgroup. I just bought an Atari 800 XL computer with a 1050 disc drive at a thrift shop. When I hooked it up to a TV, I noticed that the numerical keys 7, 8, 9, and 0 do not work! Has this happened to anyone else? Does it have anything to do with the cartridge slot door? I say this because the doors position kinda coorelates with the position of the numerical keys that don't work. Any help would be appeciated. I don't want to open up the box if there is another solution besides cleaning the contacts.
Thanks!

The local schools here used a few Commodore 64s (La Mesa-Spring Valley
District, San Diego County). But it was an Apple shop by a wide majority.

A couple months ago, I picked up a Woz signature edition Apple IIGS
for the astounding price of $20 at my local thrift store. It was in
absolutely gorgeous condition. Up to that point I never knew there was
such a "signature edition."

I've never seen a black Apple. I thought they were always beige,
manila, or yellow?

> And Apple's BASIC was good, better than Commodore's anyway. No poking
>necessary.

Well, it certainly wasn't as necessary to rely on using POKE's and
PEEK's on the Apple as it was on the C64. However, here's a small list
of a few that I can immediately remember:

1) Shape tables (Apple's fascinating way of simulating vector graphics
which was never duplicated on any other machine)
2) Sound ("pop goes the speaker" :-)
3) nifty non black screen clearing (actually, this was a CALL and not
a POKE)
4) Screen switching (for flicker free animation)

> Where Apple fell down and Commodore excelled was onscreen

And don't forget that, until the advent of the Apple IIe in 1982, all
Apple computers only had UPPER CASE TEXT. CAN YOU IMAGINE BEING FORCED
TO READ TEXT LIKE THIS ON THE NET? WE'D ALL GO DEAF IN NO TIME! WOW! I

Apple sound? Yeah! Thank god IBM didn't duplicate that error! (NUDGE
NUDGE :-)

Still, it was an indescrebable feeling when the Apple speaker did emit
sound. It caused the whole computer to vibrate. Kinda reminds me of
Nintendo's rumble pack.

Yeah. I remember my first programming class in high school. On the
first day, our teacher told us WE WOULD NOT be programming animated
graphics. About a month later, the teacher got all excited when he
showed us a simulated vine swinging back and forth (kinda like in the
old PITFALL game). The joys of Apple graphics can never be
under-emphasized.

NOPE. Standard policy is to junk 'em in the dumpster. That's what
Monroe Community College in Rochester, New York does. Sometimes at the
yearly Hamfest I'll meet a person that dumpster dines there and
resells the stuff. Very depressing.

>Thanks!

The cartridge slot is in no way responsible for a keyboard problem on the Atari 800XL.

Here's a few suggestions for keyboard repair. All require the need to unscrew and disassemble the outer case. Once that's done check the following:

NOTE: not all Atari keyboards are created equal. Suggestion number (1) should work with all. But suggestion (2) and later will only work with the "membrane" style of keyboards.

1) There's a flimsy "ribbon" cable connecting the keyboard to the computer's motherboard. Very gently, pull this cable out of the motherboard and clean the exposed contacts (spit and toilet paper should do). Reseat the cable into the motherboard and see if the offending keys work properly.

If the above doesn't work then proceed below.

2) The keyboard is screwed onto a metal plate which applies pressure to a hidden plastic membrane containing the actual circuit traces. Sometimes these traces and the bottoms of the individual keys need to be cleaned (with spit and toilet paper?). Find yourself a small screwdriver and proceed to unscrew the two dozen tiny screws located on the metal plate. BE CAREFUL NOT TO LOSE THEM. Once everything is exposed, proceed to clean the entire plastic membrane and the offending key bottoms. Find yourself a piece of tinfoil and roll it up into a ball. It will be used to test the individual contacts on the membrane. Turn on the computer and press the tinfoil over the area of the membrain were the nonworking keys would align to. If the letters or numbers appear on the screen then you've probably fixed it and you can proceed to screw everything together.

If the above didn't work then a trace on the plastic membrane may have degraded. Check the traces for areas that don't appear fully formed

(this'll take a while). If found, you'll have to purchase a special "conductive" paint to reform the traces. It can be found at most automotive stores as part of a window defroster kit. It costs between $8 and $15.

Let me know what happens. My Email addres is aarona@localnet.com

I could have gotten a program recorder (Atari's version of Commodore
dataset) but opted to use the money toward the ultimated purchase of a
disk drive. I never regretted the decision.

As a brief asside, did you know that Atari's program recorder could
play audio through the television? There were some wonderful foreign
language program/audio tapes that were only possible on the ATARI.

(John Marks wrote about 4 bad keys on an 800XL)

John, something I have found that tends to fix keyboard problems on the 600XL/800XL systems is to reseat the cable that runs from the keyboard to the motherboard. That cable can "wiggle" itself loose over time, and cause problems that are similar to the one you mentioned.

You have to be careful when you disassemble the 800XL. If I remember correctly, the keyboard cable is VERY fragile, and tears if pulled too hard. You will also need to contend with an RF shield, but that shouldn't be a problem as long as you have a pair of needle-nose pliers to deal with the metal tabs.

I hope you enjoy your XL as much as I have enjoyed mine!

My C64 fits into my jacket pocket. (the bottom of the inside pocket ripped,
so the entire lining of my jacket is one big (and very useful!) pocket)
Getting a 1541 in there is another issue. :)

Well this has been so much fun to read I think I will ad my 2 cents.

C64 did not need slots all you did was plug it in and go no need to remove the top, no cables to screw in and no extra speakers to plug in. Great picture and great sound on any tv with no extra cards.

Yes Commodore never had support but did you really need it? I didn't. I know I can still go to my closet pull it out and plug it in and I am playing Spy Hunter in minutes.

Now I am not saying Apples are bad. If they were they would not have made the MIMIC or ApSoft-64. But when it came down to it the reason that most of us ran the 64 was for the games.

I might disagree about some of your previous statements here but I agree with you about the slots. Besides - as I already stated in theis newsgroup before having even just one slot that is external can be superior to several internal slots. Just check out the spartan - one megahuge cartridge that in no way would fit in an Apple-II. Also check out the ex2+1 from CMD (www.cmdweb.com) which gives you more external slots. Also - one advantage of brick power supplies is servicability - just replace with another if it breaks down or even upgrade to a more powerfull also-external power supply.

I must have missed something here. Any integer is already "infinitely
precise" by its very nature. Now the number 'pi' is a different story,
and sines and cosines and hyperbolic arctangents for that matter, and
most logarithms and natural logs and square roots and many fractions can
go on forever with digits after the decimal. But with an integer, there
is no need to write down a million zeros after the decimal, or a
billion, or an infinite number of zeros. You can if you want to, and
the next digit after the last one you wrote down after the decimal will
always be zero - forever. With any integer, there's no reason you can't
have what you call infinite precision.

That depends on what you mean by "only possible on the ATARI.". Sound can be played back from an audio cassette in a commodore datasette drive, indeed it can even be digitized and edited/saved/loaded as any other digitized data can.

Commodore's customer support always sucked. Luckily, their computers became so popular that a huge multitude of 3rd party companies picked up the ball and extended the C64's life for well over 5 years longer than normal. Also, Commodore at the very least take a few brief stabs at upgrading the machine (the C-128 being the most recognizable piece of equipment).

Atari, on the other hand, kept coming out with different models which were essentially the same, albeit cheaper to produce.

One notable Atari screw-up (IMHO) was the introduction of the XEP-80 which hooked up to the Atari's two joystick ports and supplied 80 column monochrome text. For far greater functionality, this device should have been connected to the Atari's DMA port but, oops, the Atari 65XE was manufactured without one in order to cut costs.

I prefer having internal slots over the external-only variety. Time
and again, companies with non-internal slots advertized external
"boxes" for extending their computer's expandability but rarely
followed through with an actual, widely available product. Such
external boxes did occasionally appear (mainly via third party
companies) but were few in number and awfully expensive. None ever
became defacto standards that a multitude of vendors supported and,
therefore, very few end-users had 'em.

What was the C-64's Spartan?

"Brick" power supplies versus the internal variety both have an equal
amount of advantages/disadvantages. I have no preference unless the
device is advertised as "portable" and circulate pictures of of the
computer in someones hand in order to prove it (but neglecting to show
the necessary, usually huge, external power supply---such as Apple's
advertizing for the IIC). Another problem with external power supplies
is a complete lack of standardization. Even power supplies that look
alike may not work (ie. Amiga 500 and C-128 power supplies).

The VIC 20 began selling either late 1980 or mid 1981. I don't know
if it had lower case ability. Regardless, it was designed to be dirt
cheap and compete with keyboardless game machines of the time. (anyone
remember William Shatner's television advertising for the Vic-20? And
don't forget that MASH's Alan Alda hocked the Atari computer line. Oh,
and then there was George Plimpton for the Intellivision. And don't
forget the rest of the MASH cast and a Charlie Chaplin lookalike for
the IBM PCjr).

Actually, to be technical the Atari doesn't have any digital track.
It has a track for ANALOG modulated tones and a track for analog
sounds or voice. I do not know if CBM used digital or analog
modulated tones. I suspect tones. The mainframe computers I've run
have large tape drives which indeed are fully digital not unlike tape
back up units for PCs.

Just picking a nit.

Actually those sounds were made to be audible to the operator ON
PURPOSE and by DESIGN! Think about it, it actually serves a valid
function. You might look under such subjects as Human Engineering or
Positive Feedback.

Jon Melbo:
> That I disagree with. Both Atari and CBM supported their equipment
> also.

I think this varies from place to place. Atari in the UK, for example, were lousy and I gave up on them (and this was true of a lot of software companies too, trying to get a 6502 assembler was something I never managed...). Commodore UK were okay, but took an age to do things but because the C64 was prolific there were other avenues open if you needed help. Apple never really pushed their 8bit machines over here.

It must be said that Atari UK improved like nobody's business when Jack Attack took over, they actually started talking to people! Commodore were their old, bloody-minded self nearly to the end, just *slightly* faster... =-)

Atari was foolish how they cut back the design of the Atari 1200XL, in Late 81' - Early 82' the spec for the "Sweet-16" project which was to become the 1200XL called for the basically the Gumby mod and for a monitor port with stereo output as well and a new enhanced SIO port using all 15 of the DB-15 connector (replacing the 13 Molex SIO connector) it also had a new wake on command line so that the computer could automatically turn on periherals when it booted up, also it was supposed to have the Parallel Bus Interface which if released in 82' would have given Atari the early lead time for parallel disk drives, the expansion chasis, with expansion cards, all around it would have been a much better system then the 1200XLs and the 600/800XL's would have been released, instead more high-end systems may have followed, but foolishly Atari sold a closed box and here came the C-64 and Vic-20 with all the features give or take that the Atari's had but with a much lower price tag, the timing for Atari couldn't have been any worse. Add to the fact that Commodore was a computer company and only that, they had more of an advantage over Atari's Home Computer Division with experience and resources, so it wasn't hard for them to literally take over the home market and sell those low cost pc's like hot-cakes. Although I'll tell you this, Atari wins hands down for looks, those C-64's and Vic-20's were butt ugly. Although the tables were turned when Jack left Commodore, the new C-128's, C-64-II's, and Amiga's looked great, while we Atari users got stuck with some really dull-ugly XE and ST systems, even the Mega ST although better looking was still very ugly.

The dual track tape drives Atari used were brilliant, you could have instructions read to you in voice and background music while portions of a program loaded, the educational series tapes and the foreign language tapes were wonderful examples of this technology that Atari really should have pushed in commercials more then just the one Atari 400 commercial.

Oh, no, they weren't. Apple didn't like the B&H clones *at all*, and
neither did they like the Franklin Ace (a superior Apple clone) or the Laser
128. They were much cheaper and undercut Apple by a significant margin, and
for that Apple hauled them into court and gave them the legal equivalent of
a flogging with a buzzsaw blade over "look and feel" and the usual legal
hogwash.

They were digital pulses, no frequency or amplitude modulation involved
in signal encoding. Hence, if *any* tone came through, even if the amplitude
sucked, the Datasette would still send a 1 down the line to the 64. Not only
that, but programs were saved twice to tape (and the copies compared), and
were checksum-ridden. Commodore tape was slow as all that's holy, but it was
also ridiculously reliable. You never saw a load error. Ever.

Wait a sec. The Bell and Howell models I saw had Apple logos on them but
said "Manufactured by Bell and Howell." We know that Apple didn't like
the Franklin and Laser clones, but I'm not so sure about the Bell and
Howell ones being "illegit."

Based on what I saw, it looked to me like they were manufactured BY Bell
and Howell FOR Apple.

Actually, I think we're *both* wrong. Some digging revealed that the Bell
and Howells sold to schools as Apple][+ clones were made by *Apple* for
B&H and not the other way around. See:

Message-ID: <36A91200.B14E9F51@sisna.com>
Source record: 55902

Mux system for the Atari 8-bit, this is New, purchased from Bob Puff for a user that had
unfortunate circumstances who had to back out of the deal. It is the basic system, comes with unit plugs into master computer, and 2 slave units. It can be used on an XL or XE system with a hard drive, as the master system, the slaves can access the master systems hard drive even if they are an 800 or a 400 (48k system), Each unit plugs into the cartridge port of the computer and you can add up to 7 slave units, BBS Express! Pro suppurts the additional units and can have up to 7 BBS's running off one master unit accessing each at the same time, provided you have the phone lines and hardware to set it up.

Open to reasonable offers shipped.

From: Patrick Robbins <Probb26666@usa.net>
Message-ID: <36a93565.0@news2.uswest.net>
Source record: 55903

From the overwhelming lack of response to my WTB message I take it that (insert cliché here) before I find a voice master.

So has anybody done a homebrew thing like it? Somebody on comp.sys.robotics was talking about a zero crossing recognition system he built using a timex sinclair. The hardware was very simple and only consisted of a couple of limiters, no a/d needed. I could easily come up with the hardware but the software is another question. It should sample the inputs to create a template which is averaged over three trials when in teach mode. When in recognition mode it has to compare the new input with the template and determine the error somehow...or something.

> introduction).
>

Lesse.. 25,000 bps is about 3125 bytes per second, average time for a
1541 reading a disc is 350 bytes per second in "normal" mode. Most
fastloaders went up to 8x or 10x regular loading speed, so 8x350 is
2800, 10x350 is 3500 bytes per second. So, it is possible.

> How does the HD retain the device number if it's accomplished only in
> software?

AFAIK, the HD writes the device number to internal memory on the HD
itself, and it's DOS load's it into memory on power-up.

Nope, because you said:

> Or the alternative method is to simply take out the BASIC cartridge
> before you turned on the computer and automatically load DOS from disk

Which implies that Atari DOS is also loaded in from disc. So, the
result is a stalemate in ths regard.

> Not by Commodore. They did eventually come out with the 1571 drive
> which, when combined with the C-128, gave a noticeable improvement in

>

What is the Atari standard speed? And I believe there is a hardware
modificaiton out there that allows the C64 to read the extra data line

hooked up to the 1571/1581 drives, and use BCIS.

> FLI, IFLI, UIFLI?????? What do these mean?

Different graphics formats for the Commodore.

Commodore programmers have proven time and again, that the machine is
NOT limited by it's hardware, but rather, by the programmer. Inovative
programmers keep doing better and better things, pushing the machine
past "known limits".

> What is FLD and VSP? I'd really like to know about this trickery. I

That really is irrelevant. What is relevant, is how much technical
info Atari made available and how soon after the release of the
hardware. Two or three years is an atrocity if in fact that is how
long it took. I say six months should be the most you should have to
wait.

What Aaron is talking about is analog recorded sound, exactly as you would
get if you used your stereo system to make a cassette. (Well, not exactly,
since it can only take one track of an Atari cassette. The other track is
used for computer data, of course.)

I can't tell if the Commodore can handle that or if you're talking about
digital sound -- computer data which just happens to represent sound, stored
on the tape like any other computer data.

: : The machine's parent company supported it better than Commodore did
: : for the 64 (face it, every other computer was better supported!).

: I don't know what that's supposed to mean. Commodore had pretty good
: support, particularly with programmer's resources. Atari was notorious
: for withholding technical documentation.

Sorry, I'll expand that to something intelligible :)
Atari made a strong commitment to the 8-bit line by improving and
expanding the range (XL, peripherals) in the mid-'80s after Tramiel
took over. Even the amount of "noise" Atari made about their support
was greater than Commodore's.
What did Commodore do? The C128, scrapping it 3 years later.
The 1750 REU? Stopped production after 6 months due to DRAM shortage.
1581? Only released it in USA and never advertised it. Here in Australia
Commodore was repeatedly begged by the local press to introduce the
REU and 1581, but never did.
A new model 64? Nope, the 65 never made the Alpha stage.
Analogue mouse? Berkely Softworks had to request the 1531.
Advertising? It was good in this country (John Singleton Advertising
had their account!) but elsewhere?

Of course as the saying goes- the grass is always greener on the
other side of the fence.

: What did Commodore do? The C128, scrapping it 3 years later.

Commodore sold 4.5 million C128s. How did the 130XE do? Hell, did all of
the XE machines COMBINED sell 4.5 million?

: The 1750 REU? Stopped production after 6 months due to DRAM shortage.

Hardly Commodore's fault. And the 1750 Clones shipped for a long time
after that.

: 1581? Only released it in USA and never advertised it. Here in Australia
: Commodore was repeatedly begged by the local press to introduce the
: REU and 1581, but never did.

The '81 was a pretty specialized item when it came right down to it. The
Commodore press talked it up and it was pretty well available over here.

: A new model 64? Nope, the 65 never made the Alpha stage.

As the proud owner of a 65, I have to say that while it's neat, it's
probably for the best that it wasn't completed anyway. (All of
Commodore's divisions recommended against it because they didn't think
they could sell it, and they were probably right: I don't think the world
wanted a Super-64 in 1990-1991.)

Source record: 55952

Getting back to the point ....

Mini Office II is not Y2K compliant because the database bit has a field type of 'date' which only allows a two digit century, which means that sorting and querying on such data can produce incorrect results. Has anyone got any other databases they could check out? Or what about the old finance app called Home Accounts Manager or something similar, this must have some dates in it?

Also, old versions of Spartados tick over to "01/01/:0" [with a colon in the century] over the millenium, although the days are correct and leap years are allowed. Can someone confirm whether newer versions (and which ones) are properly compliant?

A 50,000 production run is quite low for a computer. Also, this doesn't mean that 50,000 still survive. I would estimate that half of those 50,000 no longer survive the rigors of time. Of the 25,000 left, many probably have developed problems or are in degraded condition (ie. not MINT CONDITION). And few of those (perhaps 5,000?) still have the original packaging or manuals (an all-important requirement for serious collectability.) Many Star-Wars toys from the 70's aren't rare and yet they command astounding prices in the collector market. (Wait'll Hollywood makes a Sci-Fi trilogy based on the Apple computer and you'll really see the price of old Apple equipment zoom! GRIN.)

> I believe you are perhaps missing the bigger picture here: it is the
> Atari people that are saying that the 64 is comparable to the Atari.

Nooo.. i didn't say that... I (as an Atari person) am only 'hearing'
arguments that aren't convincing me that the c64 is 'better' than the
atari (which, if i've gleaned my info correctly, was 3 years older than
the c64) For instance, Compute mag printed a c64 type-in to give the c64
'atari-style' graphics modes and syntax ('modes' as best the programmers
could give a 64 *which i'm not saying is either good or bad*)
in fact, i don't believe articles like that were written to convince
ANYONE of one machines superiority over another, just simply that: If we
do this, then our system will have similar capabilities to another
system. I can only think of ONE program EVER written to give an Atari 8
bit a c64-type of similarity (w/ the deliberate attempt to give it the
c64 similarity) <- (i haven't explained that remark, so it seems
repetitive, but there is an 'as opposed' point of view and i don't want
to go there just yet) :) Anyway, that program was designed to give the
pokey chip sid-type waveform sound capability. Excepting THAT, i read a
lot of posts here that (basically) say: "Well, the C64 can do that too!
(if we program it specially for that)" I don't see Atari people saying
(w/ the above exception about the sound) "Well, if we program our
machines like this, they'll be more like a C64!" Also, earlier when i
stated my opinion about the 2 machines, i never said the c64 was a bad
machine, i like my atari better. i feel that 'out of the box' the atari
is a better machine. I wasn't thinking about 'what can we hack on to the

box to make it neater!' Also, as a final point, selling the most computers doesn't mean that a company has the best hardware...

> This quite a step up from the "Atari, designed by deities and known
> only to a chosen few, was overwhelmingly superior to the 64 which only
> sold well due to cheapness and C= 'dirty tricks'" argument of a year ago.
>
> In fact, it seems to me that if _Atari_ people think it is comparable,
> then it must indeed be quite markedly superior!
>
I don't... I think the c64 is a sub-Atari machine, better than an Apple (which i actually like, i now own a II+, and i've heard a music demo *speaker pops!* that actually carried on 3-voice harmonies, which i find impressive given the capabilities of the machine)

Here's a question, Did anyone ever program a (for a lack of a better term) multiplex sound channel song for either computer? (you know, 8 voices on the atari instead of 4, w/o the Gumby or other stereo upgrades? or 6 voices on the c64? can it even be done or not?)

> -Steve :)
>
^^^^^^^^^^ I'm thinking i should have probably 'cut' that.. but i didn't! :)

One more point (will i ever shut up? :) I really feel that here in the USA (back then) Atari actually DID give pretty good customer support (maybe even EXCELLENT - for the time) but, once they started down the path toward the DARK SIDE, support was the first to go! (well, maybe that's a tie with advertising/marketing! :)

Yep, I heard that.. I read it in the "Reader's Feedback" column in
Compute! magazine; somebody wrote about hearing beeping sounds through his
speaker when loading or saving to cassette on his 400 or 800 (I forget which).

Think of the Atari cassette as a stereo tape deck... on one channel, (let's say 'left') you have the digitized sound of the computer program. The other track, could be another sound... could be music, a voice.. what ever... in the language series, Italian, French, Spanis, German... different short progams would be loaded and run.. so the on scrren graphic would be, let's say a person at an airport... the program would then cue the cassette tape to run/play til cued'.. that would be an actual person's recorded voice reciting the phrase seen on screen.... Sammy the Sea Serpent is a great story for kids that makes a lot of use of both tracks.. a woman tells the tale, and the graphics continue to load, run, then change...Since the system is mono, the voice track runs thru the computer right out to the monitor... if it were stereo, it would sound like the old Beatle records... voices singing on the left, instruments on the right!

I'm not aware of any software for the Atari that "multiplexed" the
POKEY sound chip, although I assume it would be possible.
Unfortunately, it would probably significantly degrade the Atari's
processor performance for other tasks (such as animation). As a brief
aside, while reading info on MAME, I noticed that alot of older arcade
games also used one, OR MORE, Atari POKEY sound chips.

Some software (OCTAMED?) for the Amiga did achieve software controlled
sound multiplexing but, as stated above, the processor performance
degraded significantly (30%?).

Considering the lack of true hardware support for sound on the Apple
II line, some programs were able to achieve some amazing sound effects
while, at the same time, producing sprite style animation in software
(ie. MsPacman). Unfortunately, the processor had to be seriously tied
to poping that damn speaker cone in REAL-TIME!!! The effective
processor degradation was anywhere from 10% to over 90%!!!!!!!!!!

Jason, it's nice to know that somewhere in this world people have
respect for machines :) I can tell you that not having respect
sometimes goes beyond the juvenile set.

In my wife's school, there was a computer lab. The kids would take the
mouse balls out and toss them around. One day, a substitute teacher got
tired of this, so she filled each mouse with Crazy Glue. You can guess
the result and how long it took to replace the mice.

John,
With the replies about removing the ribbon connector from the motherboard, I want to give you this additional word of caution, if it's not too late. When you look at the motherboard where the ribbon cable from the keyboard attaches, you'll see a connector attached directly to the motherboard. Way back in my early years, when I got my first Atari, a 600XL, I thought that the connector was a permanent part of the ribbon, and that the CONNECTOR slid off the motherboard. IT DOESN'T. The cable is gently pulled out of the connector. When you pull it out, you'll have JUST a ribbon cable with bare contacts on the end. That's it!

Jason Hedrick

I do have OctaMED on my A1200. I don't know too much about the package, but
AFAIK it does do some Paula tricks, yes.

aarona@localnet.com (Aaron) writes:

>What was the C-64's Spartan?

The Spartan Mimic was a device that pulled simultaneously into all the exterior ports of the 64. It connected to main RAM through the expansion bus and essentially used the 64 for keyboard and RAM only. Inside the Mimic was the CMOS Apple][6502 variant, the system ROMs, and glue logic. It allowed all the regular Apple peripherals and emulation was essentially 100% because it was really just an Apple in a box with no keyboard or memory.

It was very expensive, and not many units were made. I don't know if one exists these days.

No, the Commodore tapes are digital only. There is no analogue track. (Good
to see you off the classiccmp list. :-)

I think you mean disk drive. A friend of the family has a 65XE and his Atari
plays intermittent beeps through the speaker when disk access is in progress.

Those continuous beeps through the monitor's (or TV's) speaker also occured with disk drive access. A program could reduce this sound to a muffle but not completely get rid of it. Although this may sound annoying, strangly enough many Atari afficionados (including me) grew to love this Atari quirk in the same way alot of people love Cindy Crawford's facial mole. Too bad IBM based Atari emulators couldn't incorporate these sounds. There's nothing like owning the original equipment!!!!!

Does kind of give the impression that if as part of your comparision you
said, "The Atari 800 weighed more then the C64" someone would comment
how they used to fill their C64 with lead fishing weights to the point
where it was 10 times heavier then an Atari.

Yup. Now that would be nice. Only two things wrong with them, from
what I've seen:
1) They run off WinBloats
2) They are so *blasted* expensive

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

I've got a couple of Atari tapes that played music while loading
the program. I also have the Atari Talk & Teach cartridge which
was used with cassette tapes - it would narate lessons while
providing info onscreen & asking questions. The catalog showed
there was 17 courses offered, ranging from elementary thru
college level.

For thoses people concerned about when this was available,
they came out with the inital release of the 400/800 in 1979.

But this is an all too common story, compare the 3do to the SNES (released
about the same time), the difference is emense.
And one or two games on the 3do still outrank their PSX counterparts,
difference is that the 3do console died a long long time ago, PSX is still
very much alive and kicking.

This is routine today. most C64 music has atleast 6 voices, some have even more.

I heard a song recently, from our 1998 4K-compo, that sounded like it had a good 8 or more voices in it.

Of course one can also add hardware such as the SID Symphony cartridge, which gives 6 actual voices.

A good music programmer could pull off a cool 12-15 voices out of a 6-voice machine.

Aaron,

Whew!!! That was quite a message you wrote, very well written, I liked the fair comparisons. Just for a little bit of added information. The reason why the C-64 and Vic-20 came to market 3 years after the Atari 400/800 was that Commodore did not have anything like that in 1979, and in fact I've spoken with the 3 people who designed the Vic-20 and C-64 and they admitted to the fact that Jack had them look at the Atari's and copy its features and package it into a low cost system. Also the Vic and C-64 never had a peripheral bus, simply a cassette port and an IEEE bus connector that was made to transfer data in and out of the machine, so transfer rates were painfully slow. Commodore has a huge advantage over the Atari's with upgradability, the Atari chipset is very closely tied together, so to upgrade or speed up one chip effects all the others, so upgrading the CPU, video and such has never been very successful in the past, so Atari's strengths: its custom chips are also its downfall. The SIO bus although very costly to design peripherals was a concept way ahead of its time, in fact look at todays new hot communication standard, Universal Serial Bus, where everything is daisy chained to a single interface, in fact the designer of the SIO bus for the Atari 800 is also one of the patent holders of the USB design working at Microsoft today.

A close friend (he lived just 3 houses from me) liked purchasing
Commodore equipment (first the Vic 20 then the 64) and, based on what
I saw at his house, I almost purchased one in late 1984. Why did I go
for an Atari 800XL instead? When I walked into Child World with cash
in hand I found out the Atari was just marked down to $89.95; a full
$25 less than the C64. Of course, I had to wait six months before I
got a disk drive, which was almost double the price of the CPU!!!!!

Unfortunately the SIO bus although advanced for its time was expensive to develop
peripherals for and that was its downfall, items which should have cost 1/4th the
price had to have an intelligent communications control and then its own
controller so items were very very expensive. The XL series with its Parallel
bus could have solved many of the problems with PBI based devices, but the devices
meant to be released never got a chance when the Tramiels took over Atari and
cancelled all of the products.

You missed my point. In the real world, with measured values, such as <italic> weights as determined by a scale in a post office </italic>, there are no such things as integers. Integers are a (very useful) mathematical abstraction when it comes to measuring quantities on a continuous range (i.e. when talk about the set of real numbers.) No one has ever seen a length that was exactly an integer number of some predefined units and known that it was exactly an integer.

When you write an iteger with no decimal point, and it's understood that it's and integer, you're using a special notation euivalent to specifying infinitely many zeros to the right. You can't compare that with a real number like pi or the sine of something as if it were the same notation. Ok, it's understood that we mix the two notations, and we don't usually distinguish, but in this case, the difference matters. When I was talking about 2.000000..., I was representing an integer in "real number" notation, and I was doing it because that notation correlates directly to the way measurement, in general, works. The whole goal was to show that integer measurements are impossible, because you can never get it as exact as an actual integer.

There is nothing to credit the c64 with as far as bringing down prices, it was the introduction of these low cost pc's that caused everyone to suddenly change course and go into a cost cutting frenzy and instead of enhancing the systems in the right fashion, the machines were stripped of features and the companies (especially Atari) spent more time doing research into how to remove an extra resistor here, capacitor there instead of focusing on enhancing its chipsets with better graphics and sound and such, TI dropped out, other companies dropped out before comming out with products, then price got so low, the video game industry began to be questioned, why bother buying a video game for $199 when I can own a computer for $199??? So in a sense many companies were badly hurt from these low cost machines, it was great for Commodore though :)

> exception about the sound) "Well, if we program our machines like
> this, they'll be more like a C64!"

We're not trying to make the C64 act like an Atari but we're being told
here that "the Atari was better because..." and in a fair few cases the
"because" is something we've already *done*. Unless, of course, the
Atari magically does all the things Aaron listed at power up without any
code being loaded it has to be programmed specifically for those jobs as
well doesn't it?

"Out of the box", the Atari has the faster processor and more colours,
the C64 has better sprites and sound but it's not just a matter of
having these things and just living with the limits the hardware sets.
I don't know about the Atari people, but the C64 folk are constantly
trying to get more out of the machine, not due to an inferiority complex
of some kind but because it can be done.

When the Blackmail people sat down and wrote the first FLI routine they
weren't thinking "we could pretend we have an Atari here!", they were
trying to make the C64 better. The result was a routine that isn't
documented in any Commodore literature and can increase the colour
resolution of the screen.

> Here's a question, Did anyone ever program a (for a lack of a better
> term) multiplex sound channel song for either computer? (you know, 8
> voices on the atari instead of 4, w/o the Gumby or other stereo
> upgrades? or 6 voices on the c64? can it even be done or not?)

On the C64, the most done with note plexing was seven voices by Apex (it
was on the music selector demo of the disk version of the game
Retrograde) and Martin Galway managed to get what sounds likes three

channels from one on the Wizball bonus run tune.

The Cosine player, EMS v7.03, can wedge a percussion channel in
"between" the standard three to give a fourth channel without plexing.
Add a polyphonic sample player and six shouldn't be hard...

That's a very good point. While lacking in sound and graphics, the
Apple II did have slots, fast parallel disk drives, 80 column support
and well supported expanded memory early on. Atari is still my
favorite but the Apple had us all there (til the PC came out).

>It also had one other thing Atari and 64 never had: support!

That I disagree with. Both Atari and CBM supported their equipment
also.

Source record: 55738

I remember when I got my Mac PowerBook 5300, I needed a modem BAD. I used the SX212 to get online. It took me awhile to set it up as far as a connection and I couldn't figure out why it wasn't working. I studied the modems command lists and everything but still couldn't figure out what was happening.

Remember, I said I used it on my Mac. Of course I had a cable adaptor for the mac port to RS232, BUT the reason it didn't work was because it wasn't flow-control compatible. So I bought a new one and it worked like a charm.

Downloading stuff on a direct ISP was a different story. I used to DL stuff and about 1 hr. later, the server I would go on would disconnect me.

I figured out how to solve that problem though, I used AOL (eek..) since it has the DL queue and I never had to worry about losing a connection (this was before AOL had that lil' problem w/ connections:).

I remember I used to start dowloading stuff before I would go to sleep and it would be done by morning:). A 16 Meg demo. version of Marathon 3 for Mac took me two days to DL...hehe...memories. DON'T GET ME STARTED IF SOMEONE PICKED UP THE PHONE LINE!!! I got a new one just for that.

When I got my 33.6 I didn't know what to do w/ myself. That Atari modem sure was helpful for downloading while I was asleep and it sure got the job done. Thank God AOL was unlimited time by then also:)

Laters,

Source record: 55739

I ran across a Chalkboard Powerpad for Atari 8 bits made by Chalkboard
Inc, of Atlanta
Georgia. I have been unable to locate the company.
I have the user's manual and software plus the "pad" but i am missing the
SIO
cord for it. The pad has what looks like a phone jack for connecting to the
computer.
Does anyone have or know where I might find the pinouts for this cord?

I would appreciate any help you can give me.

Thanks in advance,
Phil

During its heyday (late 70's & early 80's, Atari tried to keep
everything proprietary and secretive about the internal workings of
its equipment (anyone remember their failed lawsuite against
ACTIVISION? It was a very historical moment in the history of console
gaming). I remember, during the mid 80's, going through Microfiche of
BYTE and CREATIVE COMPUTING magazines in search of Atari programming
info which didn't appear until the issues dated mid 1982 - at least a
full 2 years after the Atari computer's introduction. I believe, but
am not certain, that De-Re Atari was initially intended as internal
documentation for the company's programmers, and only became available
to the public when they (ATARI) realized the error of their ways.

All the documentation you mentioned ultimately (1982-3) became
available to the public

One of the advantages of the Atari OS was that it was COMPLETELY
MODIFYABLE AND EXTENSIBLE. One proof of this was a small third party
OS extension/replacement which sped up FLOATING POINT CALCULATIONS
(manufactured by NEWELL?). The ATARI OS was a thing of beauty in that
ALL devices (be it disk drives, printers, screen display, graphics
drawing and area filling, program recorder, editor, etc) could be
accessed in a very generic way. Also, other operating system routines
were accessed via vectors (as opposed to the early Apple OS method of
jumping directly to the OS code, which made it very tough for Apple to
enhance the OS or 3rd party companies to reverse engineer the OS).

As far as I know, the C-64 series of computers (this includes the 128)
were the best selling 8-bit computer EVER. By the end of it's run,
Commodore had sold close to 20 MILLION of 'em. That's an incredible
number, especially when you consider none of these were clones.

I am uncertain of the number of Atari's 8-bits sold. My totally
uneducated estimation would be around 6 Million.

>Intellivision), cheap mouse, and an extremely slow GUI via GEM).

GEM is not slow, only the Atari implementation is terribly sluggish,
esp. in TOS 0.x and 1.0. A good workaround is replacing the internal
Virtual Device Interface with NVDI. And Atari did not any more have
the knowledge to publish a super Atari computer, as Amiga Technologies
(where AFAIK most VCS2600 and 800 developers where employed) was alrea-
dy bought by Commodore at that time.

And admitted, the ST graphics and sound capabilities are not impres-
sive, with the exception of the 640x400 @71Hz b/w mode (here in Ger-
many, a vast majority of STs were sold with SM124 monitors).

Lots of early childrens programs used the low res modes. Remember,
when the Ataris first came out, the price of RAM was significantly
higher than when the C-64 finally showed up in '82. the average amount
of RAM during those early Atari days was about 16K (sometimes as low
as 8K).

SID was much more sophisticated than POKEY's 4 voice sound. It was
also significantly harder to program (and it's main flaw being the
inability to change the volume of individual voices). However, this in
no way means that Atari's POKEY chip was primitive. Bothe these chips
were far, far better than what the IBM and Apple had.

>>The sprites _were_ far better than the Player/Missile concept. I guess

Hey, that's really cool but... any chance of running an IRC server
instead? That is what IRC is for and it is much quicker, robust, and
less of a hog. IRC clients are made for virtualy every somputer on
the net too. There are some IRC servers that support both web based
and IRC client based chats together in the same chat. That would be
the best, since it takes care of all.

I have the OS listing, both A and B versions, but I am interested in
the hardware in the 410/1010/XC11/XC12 which converts the FSK sounds
into the bits you find on the DATA IN line.
All the OS does is program POKEY for the proper bitrate, and then
POKEY decodes the bits all in hardware. So I want to know why it is
that even though I generate mark and space tones at the same length,
like wjen encoding a byte of hex 55, that the space bits are shorter
than the mark bits.
I want the cassette unit to output perfect size bits, and thus I need
to know how it is exactly that the tones get decoded into bits, and
how one tone affects the other, since they do.
Thanks for the offer though.

Nothing more than eight a line can be done, the hardware won't let you.
How many can the Atari do?

> This *MAY* work in the vertical direction, but what about for
> horizontal scrolling? Normally, most computer graphics screen
> addressing is sequential.

Linecrunch will push the entire screen around, even to the point where
it wraps, in both directions no "*MAY*" about it. You can move it as
far as you have space for map data and if you're just repeating a single
picture the distance is infinite.

> For example, if the addressing for the upper left corner of a 40

That's how the trick works, you just write to the column or row that has
just wrapped around. Dead easy. We have games and demos that *do* it.

> The Atari, through the manipulation of a hardware based DISPLAY LIST,
> can set up a custom screen where the beginning of each graphics line
> could be located anywhere in memory... ...Oh, and all of this is
> achieved without a single RASTER INTERRUPT. THIS ATARI CAPABILITY IS A

> MIGHTY POWERFUL TOOL FOR A PROGRAMMER.

What happens if the map has to be some 30 screens long and not displayed in text mode? The old Touchlight preview (sadly the game was never released) did that once a level *and* had a lot of sprites over it.

And Stormlord does it for *real*, scrolling two thirds of the bitmapped screen by physically moving the data and at full framerate. Nick Jones (Stormlord 64's coder) is a genius in my book...

> BASIC is also code. I assume you mean Assembly. Real programmers don't
> even use that. Straight Machine Language is the way to go (numerical
> OP-CODE memorization is very MACHO).

Been there, seen it, done it. Started 6502 on a VIC-20 without any extra RAM, so I *had* to...

> Also, don't forget that the Atari can also achieve overscanned

> SPRITES!!!!!

Good job really, considering the Atari sprites, eh...? =-)

Fungus:
> I can split the screen anywhere I want up too 6/7 times :) and that
> HORIZONTALLY, I can split it every line vertically, FPP is a nice
> effect!

Aaron:
> Are you trying to say that the C-64 graphics display can be split BOTH
> in the horizontal and vertical direction via hardware (and not
> software) manipulation?

No, he's saying the software can do it (record stands at 14 vertical splits across). But why make the hardware/software distinction? The option of doing this sort of thing through software was there from the first version of the machine, it's not as though it's some "bolt on" upgrade. And surely the setting of the display list requires software to do it, unless the chip is psychic...

> I'll have to pull out one of my books to get specific info on address
> $DD00.

The lowest two bits indicate which of the four blocks of 16K the VIC-II is reading. Both set is the lowest and both clear is the highest.

Fungus:
> ...stick are 5 bits! damn your wierd!?

Aaron:
> ....AND A WASTE OF PROCESSOR TIME!!!! DAMN YOU'RE EVEN
> WEIRDER!!!!

Reading the C64 joystick is a doddle and very short on time. Four cycles to grab the info and four more to check each direction. The

amount of time you take to process the event is, of course, up to what
you're doing.

Hi Bob,

The Apple III came out I think in 1983/84. The hard drive you mention is called an Apple PROFile drive and was compatible with the Apple III and the Apple LISA (MAC XL) and came in a 5MB version, but could also be upgraded to a 10MB version by swapping HD mech's. (This was during the time when the former CEO of Pepsi was running Apple and didn't know squat about the computer market.) The Apple III was a failure, it was incompatible with many Apple][programs and its expansion cards were proprietary. The Apple III disk drive had some issues and the biggest problem was the failure rate of the Apple III's were second only to the hideous failure rate of the Coleco Adam's which had an almost 100% failure rate and return.

909. UK 8-bit Computer Users Convention - September 1999

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-23 00:00:00 UTC
From: Brian Watson <brian@spheroid.demon.co.uk>
Message-ID: <917131144.18644.3.nnrp-06.9e98ea3a@news.demon.co.uk>
Source record: 55753
Cross-posted to: alt.c64,comp.sys.amstrad.8bit,comp.sys.oric,comp.sys.sinclair,comp.sys.atari.8bit

As previously mentioned here, there is to be a big get-together for 8-bit computer enthusiasts this year, and I now have more details.

It will be called "The UK 8-bit Convention", or "UK8" for short, and will be a cross-format event for *all* 8-bit computer enthusiasts. Rather than just being a "buying and selling" event, we hope to give users a chance to show off their preferred computers and software, as well as providing comfortable facilities for socialising.

All the costs of the event will be underwritten by the IEBA (Independent Eight Bit Association) and the CPC users' club called WACCI. Neither club will take any money out of the "UK8 Convention" bank account beyond legitimate and properly accounted expenses, and *any/all* profits will be put back into a fund towards holding a similar event next year.

UK8 will be held in the English midlands (Birmingham area, very near the M6) on a Sunday in September 1999. The precise date, times and venue should be confirmed here next weekend.

If the most likely venue *is* confirmed it can accommodate up to 300 people at a time, and it is on ground level so wheelchair access will be no problem. A bar on-site would be open from 12 - 3.30 and a choice of eating facilities, including a McDonalds restaurant, are either on-site or very near the hall.

Once the venue is confirmed a layout plan will be drawn up.

Tables (with space behind them for chairs and display boards) can then be booked by representatives of clubs, magazines and individuals, at a cost of five pounds per table. By keeping table costs down, we hope to involve as many of the smaller support organisations as possible.

Only once the clubs etc have had an opportunity to book space, will appropriate companies be invited to reserve tables.

We expect the admission price to be 2 pounds per person, with admission to be by ticket only to ensure the event is not oversubscribed. We'd rather run a second similar event than have it too full to move around comfortably.

For further information, or to be put on our e-mailing list (your contact information will *not* be shared with anyone else, by the way) send a note to UK8@spheroid.demon.co.uk

>What was the C-64's Spartan?

The Mimic Spartan was (or is) an external interface device which is
said to make the C64 fully compatible to the Apple II Europlus. The
device is connected to the Expansion Port of the C64 and will enable
you to run any Apple II Software on the C64. It doesn't influence any
C64 functions and allows switching between C64 and Apple mode at will.
It includes a 6502A Processor at 1MHz and 64K memory and provides you
with eight Apple II compatible Slots. The VC1541 is said to be able to
read and write Apple II disks using the Spartan.
Furthermore the system is able to tell automatically wether there is a
CBM or Apple disk in the drive. It goes for $599 plus shipping.

At least that is what an Article says taken from the German computer
magazine 'RUN' issue Feb/'85.

It even gives an Address:
Mimic Systems Inc.
1112 Forth St. F1 6a
Victoria, B.C.
Canada V8V 4V2

But I dought that it has any relevance 14 years later.

>
>Nooo.. i didn't say that... I (as an Atari person) am only 'hearing'
>arguments that aren't convincing me that the c64 is 'better' than the

Hmmmm. Well, although I haven't been following very closely I have
seen very few arguments from C64 people about why the 64 might be
better, or more advanced. Therefore, perhaps I will make a few arguments.
I'm a pretty simple guy, so these will be pretty simple arguments --
three features which 64 people perhaps take for granted, but which
I find invaluable for serious programming, and have often missed while
working on other computers. I'll leave discussions of cute effects
and obscure hacks to others.

First, turn on the computer. I think it's awfully cool that you can
immediately start typing and moving the cursor around, but the issue
here is color RAM: press CTRL-1 and type a letter. Then press
CTRL-2 and type another (perhaps a graphics character). Keep on
going and you'll have sixteen characters, each of a different
color -- sixteen colors on the same line. Is that really an
advanced feature? Well, consider how many other computers can
do that. The Atari can't. Neither can the Apple. An IBM can't
(not in text or CGA mode). Even an Amiga needs four bitplanes --
32K as a minimum -- to do it. I think perhaps the CoCo can do it,
but the point here is that other machines need quite a lot of resources
to duplicate this simple feature (when they can duplicate it at all).
So, what is it useful for? Why, everything. It means screens -- hires,
lores, text -- are always colorful. For example, I wrote a music composer.
The main editing screen contains lots of information and text -- how nice
it is to have note data in one color, player data in another, editing
info in another, alert text in another, flags in another, and so on.
And all in a 1k graphics screen. More generally, game objects can be of
different colors, there can be different-colored windows on the screen --
the list goes on and on. Nearly every 64 program uses this feature,
and with good reason: it is an extremely useful and powerful feature.

Moving right along, the large majority of silicon real estate on
VIC is devoted to sprites. Is it worth it? C64 sprites are
24x21 objects -- a nice size for many game objects. There are
eight of them, and they behave identically. They can be multicolor,
generate interrupts upon collisions, and so on. And most importantly,
their X- and Y- positions are directly controlled by a register.
And once again, the Apple can't do that, the IBM can't, the Atari
can't, and many Amiga programmers only wish the Amiga's sprites were
so straightforward. By comparison, the Atari's players are
eight pixels wide, must be copied manually to move vertically,
and there are only five of them (or four players+four 2-pixel wide
missles). Not only do many programs use sprites, but many games
would simply not be _possible_ without sprites. Only the dedicated
game machines (Nintendo, Genesis) have a similar (and superior)
capability, and with good reason -- sprites of this power are
extremely useful!

Finally, I'd like to mention a nifty little guy in the C64 called
the CIA. The 64 has two of them, and they can do all sorts of
useful and practical things. One of the things they can do is
count: they can count tenths of seconds, machine cycles, external
signals, and so on. There are BCD timers, 8-bit, 16-bit -- even
32-bit. And these are useful for all sorts of things -- playing
music, or digital samples; generating interrupts for operating
systems, or real-time systems; measuring the speed of code, or
of external hardware signals; something as simple as running a
clock. They are so useful that many 64 programmers probably
can't imagine doing without them. And yet, what does the Atari
have in the way of hardware timers?

Well, that's it. http://stratus.esam.nwu.edu/~judd/fridge/atari.compare
has some further details on the relative merits of the 64 and Atari,
if you're interested. I don't expect that I've convinced anyone
concerning the 64; such a task is always difficult, because the
real strengths of a machine are generally more technical and subtle
in nature, and don't fit on a spec sheet. For example, whereas
many people point to the processor speed or number of colors as
a great Atari strength, I think these are rather frivolous; a truly
powerful Atari feature is the ability to start graphics data at
any memory location -- many 64 coders would love it if the graphics
data didn't have to be page-aligned.

Anyways, while I like the Atari and think it is a fine machine,
I certainly have no problem claiming that the C64 is the more
advanced, useful, capable, and flexible of the two. In terms
of substantive features, it is simply the superior machine --
I'll trade autobooting for sprites and color RAM any day.

>to go there just yet) :) Anyway, that program was designed to give the
>pokey chip sid-type waveform sound capability. Excepting THAT, i read a

I certainly doubt that. Probably it gave pokey an ASDR envelope,
by controlling the volume -- pokey isn't going to do SID waveforms

anytime soon.

Part of the problem here is that few of the above games are considered
really cutting-edge games on the 64. Summer Games was very popular
when it first came out, and the EA games were of course popular. But
few of the above games would be on any 64 user's favorite/most impressive
games list (except MULE of course ;-). Heck, European and American
favorite games are different enough as it is.

>> or 6 voices on the c64? can it even be done or not?)
>
>This is routine today. most C64 music has atleast 6 voices, some have even
>more.

Come now, this really isn't accurate -- those aren't six independent
voices. It's not as if you can put down six tracks and "interlace"
them in some way. What is true is that clever composers can wedge
certain sounds in at certain times, giving the illusion of extra
voices -- but this in general requires careful planning and execution.

Also, this should be viewed in contrast to Amiga multiplexing
ala Octamed -- you of all people, Nate, should know about combining
several digital signals into one, since that's exactly what your
64 MOD player does :).

A bold claim -- upon what basis do you make it?

I will confess that I came to my conclusion while going through the
Rescue code to make it work on the SuperCPU. Not only can it be
sped up significantly, the gameplay can be vastly improved without
rewriting any routines at all -- somebody really dropped the ball
on that one (or, more likely, it was ported straight from the Atari,
with as little effort as possible).

>>SID is really rather sophisticated -- each voice can have four waveforms,
>>an ASDR envelope, filters, different pulse widths, and so on.

>SID was much more sophisticated than POKEY's 4 voice sound. It was
>also significantly harder to program (and it's main flaw being the

Another bold claim. Fair enough -- you post some code to do something
with POKEY, and we'll see how complicated it is compared with code
to do the same with SID. How about using a noise waveform?

>inability to change the volume of individual voices). However, this in

Although I know why you think this, you are neglecting one of SID's
powerful features: the ADSR envelope. The S stands for Sustain --
the volume level that the note is held at. Not only can each voice
have a different volume, each voice can have an entirely different
volume envelope.

In addition to that is the "master volume", which is what you are
thinking of.

Aaron <aarona@localnet.com> wrote:
>
>3D effects with 100's of colors in full screen at 60fps are simply not

True, but a very enjoyable game can be made without 100s of texturemapped
colors. Indeed, the most common complaint about PC games is that
they spend all their time on fancy displays, with only minor thought
given to the game.

Regarding 3D effects, state of the art routines on the C64 (and the Atari)
are more than capable of doing true 3D worlds. I would not term them
"rudimentary" -- the fundamentals are sound, and only lack the more
frivolous or superficial features (e.g. super-duper texturemapped graphics).
In fact, as far as fundamentals go, I would say the routines are
more advanced than most PC routines -- certainly more efficient.
I think a 20-30fps wireframe game is well within reason; 5-10fps
for a fullscreen, solid-polygon game.

>One of the advantages of the Atari OS was that it was COMPLETELY
>MODIFYABLE AND EXTENSIBLE. One proof of this was a small third party

And one thing many non-CBM people don't know is that the 64 OS was
also rather open and extendable, as most of the major routines
(including the math routines) are vectored. It is also flexible,
in that the same i/o routines are called for all devices, be they
disk drive, tape, screen, etc.

With all this, though, very few OS extensions ever appeared -- in
general, the 64 OS is either good enough for the job or isn't needed
at all. One notable exception is fastloaders -- like most routines,
LOAD and SAVE are vectored. Divert that vector to the fastload
code, and off you go.

Regarding Atari FP, the original floating point routines are BCD --
in other words, almost totally useless for calculations (except
financial).

Finally, regarding being a thing of beauty, here is how you output
a character on a C64, be it to the screen, disk, etc:

```
LDA #13
JSR CHROUT
```

Care to post the code for doing the same thing on an Atari?

My personal feeling is that the Atari OS is a decent idea which
is for the most part fairly impractical and unnecessary for an
8-bit computer. That is, as a theoretical proposition it is fairly
attractive, but as a practical implementation it is fairly cumbersome.

-Steve

Steve, thats ALL you need? WOW! the C64 KNOWS where you want the character 13 to go? or will it send it to the screen AND the disk AND the printer AND the cassette?

Although it is neat, I have seen ALOT of C64 programs that used the
different colored text ALL OVER the screen to the point where reading
the text was a real eye-strain.

But I do agree, with restraint it is a useful feature.

The cable I have with mine is a six-lead phone jack at one end, and a female joystick connector at the other. All six pins are connected at the phone end, but I couldn't pry open the joystick plug end.

Incidentally, the box has a sticker that says Atari-Serial on it. I don't know if that means they made an SIO version or not.

Good luck,
Jeff

That depends on the specifics. If I am not mistaken there is a demo out there called mood that is a doom game for the standard c64. Also - I think you have allready been given url's for the various screen modes of the c64 (like fli and ilfi for example), I recommend you read more carefully. Correct me if I'm mistaken.

The standard dos is within ROM so the c64's dos loads automatically, too, as soon as you turn the system on.

To clear this up a bit - an analog audio cassette (such as a mettalica cassette with voice and other sounds) is inserted into the commodore cassette drive and a special program is loaded. Then when the program says "please press play on tape" and the play button on the commodore tape drive is pressed the computer reads the analog data as digital data. If I haven't forgot how digital works then that means that the analog data that when played back has a signal that is either on (strong signal) or off (weak signal) and the program can digitize (or capture) the data, Thus digitizing voice and sound on the commodore 64 is easy with this method. Anyways it's an awesomely cheap,easy, and a special unbeforeknown bonus extra that commodore users get.

Really Gentlemen, haven't we learned anything over the years? Brand bashing is simply a waste of time and band width.

Let's get on to some subjects designed to advance the utilisation of our favourite machines rather than rehash the, often ridiculous, comparisons made years ago when these various computers were still being offered for sale and actually being supported to various degrees (in our case about degree 0) by their manufacturers.

Along with Atari; Apple, Commodore, Radio Shack, Sinclair, and others produced useful and very useable able 8-bit machines, each with its strong points (eg. a Z80-based box will make any popular 6502-based machine look sick for straight number crunching). Can we not leave it at that and look at ways Atari ML programmers can exchange ideas with their Apple and Commodore counterparts with the goal of developing something new?

John

It should be said that "the c128 has an 80 column color graphics capable display". I was actually impressed in about 1992 to 1993 about the latest atari-st model atari released - I'd rather have bought that than a apple macintosh. 16.7 million colors back then seemed unusually rare.

I didn't care much to read this Fungus persons insulting answers, but did he say the top loading speed was up to 25000Bauds ? If so, the Atari is much faster. The standard drive runs at 19200 baud and my DTI chipped 1050 runs at at least 55000. I don't remember if this was the top speed, as it was a small disk program that booted the speed even more.

Why the insulting, Fungus. Are you dumb and have to make insults to make you look smarter ?

He asked questions, why the hell not answer them properly ?

Happy to be an Atarian, but still like the C64 (even if I didn't when I was a child)

Take care all, both Atarians and Commies

And the Atari's have a lot of cool menu programs for loading games and stuff. I love the autoloading Atari's. Of course, it's not too hard to remember LOAD "filename",8,1 or ,8 (9,10,11) and such when you use it a lot. But, for booting games, the Atari is excellent. I don't think PC DOS is hard to control either as some other has pointed out, because if you use it, it sticks to your mind, unless you're drinking way too much or smoking bananas or whatever.

Sparta DOS is not my choice, but it's a good DOS as it's the easier to use DOS 2.5 or MyDos. Topdos was one of my faves, until I got a HD, which it doesn't support :-(Anybody have a newer version than 1.5 ?

Take care

I want to raise another discussion here.

Strong and weak points of games realeased on both platforms.

Dropzone
Summer Games
Bounty Bob Strikes Back
Ballblazer (was it released on C64 ?)
Rescue on Fractalus
M.U.L.E.
Seven Cities of Gold
Pole Position

Let me hear you! Why is C64 version better or why is Atari version better ?

Take care all

I entirely agree w/ that concept - after all, being truthful, 'clever'
programming is how you get all 256 colors to the screen in an atari (tho,
usually done thru dli's which is one function they are available for, and
i've heard you can squeeze some more 'apparent' colors from an atari by
flipping the color sets during a vbi)

(not a multiplex sound comment :)
I like Rob Hubbard's 'Thing on a Spring' and 'Shockway Rider' - i've only
heard them on SID player for both the amiga and the pc, so i don't know
how they do the original justice, and even tho the instrumentation is
limited to the sid sounds, the music itself comes thru very well, i
really enjoy those 2 tunes in particular! (to Rob: Good job! :)

Using APETIME w/ the PC clock set to 1-23-2000 I get the following from TDLINE:

Spartados 3.2g: 23-Jan-00
Spartados 3.2f: 23-Jan-00

I couldn't find a copy of 3.2d offhand, so perhaps someone else can help.

Steve

3D effects with 100's of colors in full screen at 60fps are simply not
possible on the C-64 or Atari. With that in mind, I've seen some games
achieve some nice rudimentary 3-D effects on various 8-bit computers
(Atari's Encounter & Capture the Flag & Pole Position, Apple's Skyfox,
Coleco Adams, Buck Roger's and Planet of Zoom, etc).

> 8,9,10,11 2 jumpers, 4 bits, are you dumb?

That would make sense (except that two jumpers do not equal 4
bits...they equal 2 bits with the possibility of 4
combinations...IMMENSE INTELLIGENCE FLAGRANTLY DISPLAYED FOR ALL TO
SEE IN UTTER DISGUST). Anyways, just because there's the "potential"
of 4 combinations don't mean they're all implementable. Computers have
been known to waste bit combinations (ie. Commodore's weird row/column
strobing for keyboard translation when only a one byte address would
have been sufficient...as well as faster.)

> Atari barely had a dos at all,and loading from disk? what kind of
>lameness is that? oh yeah like pc, forgot... shit can make my 1541 load
>60k in 15 secs, no problem

Loading DOS from disk could have one major downfall on the Atari. In
the past I wouldn't always bother to turn on the disk drive when I
wanted to just experiment with BASIC programming. Sometimes, though,
the coded program would become so interesting that I wanted to save to
disk but, OOPS, I couldn't save it because DOS never loaded. It was,
to say the least, a minor headache.

Of course 16 bits are better than 8. But somewhere in your previous
retort an 8 bit limit had been specified.

>
>> >
> You can also have up to 144 of them onscreen at once in a single frame ;)

Perhaps vertically (via RASTER INTERRUPTS). But what about on the same
horizontal scanline? I would seriously doubt there was more than 8
without SERIOUS processor degradation.

>> >> Unfortunately, the C-64's hardware scrolling is limited and, when

>> >
>> >Unless you use FLD or VSP, tricks which cause the VIC chip to move the
>> >screen for you an unlimited distance either vertically or horizontally.

This *MAY* work in the vertical direction, but what about for
horizontal scrolling? Normally, most computer graphics screen
addressing is sequential. For example, if the addressing for the upper
left corner of a 40 column text display is $1000 the address for the
first character of the next column would be $1028 (40 bytes further).
If the C64 performed a left or right (horizontal) scroll so that the
41st column was displayed, the address from a previous row would
magically appear on one edge of the next row. This effect would
normally be undesirable for a sidescrolling action game when NEW
GRAPHICS INFORMATION needs to be displayed at the left or right edge
of the display.

The Atari, through the manipulation of a hardware based DISPLAY LIST,
can set up a custom screen where the beginning of each graphics line
could be located anywhere in memory. For example, if the side
scrolling game contained a maximum width of 3 display screens, each
redefined text line would require 120 bytes (40 colums per screen x 3
screens). In order to move the display one byte to the left or right,
all that is needed is to modify the address of the beginning of each

graphic line. (For 25 rows of redefined text, a maximum of 50 bytes
would need to be updated to reflect the next address.) Oh, and all of
this is achieved without a single RASTER INTERRUPT. THIS ATARI
CAPABILITY IS A MIGHTY POWERFUL TOOL FOR A PROGRAMMER.

RE-READ MY ORIGINAL ARTICLE!!! IF THAT DOESN'T WORK THEN WHAT
SPECIFICALLY DIDN'T YOU UNDERSTAND????

> simulate? excuse me? the c64 has RASTER irq's right outta the box ,
>NmI's too, and we got 64k ram stock, + I have 512k reu, I knw other got
>2megs +! I also got a supercpu 20 mhz accelerator? think your wimpy atari
>can keep up?

I don't remember denying Nonmaskable Interrupts or RASTER INTERRUPTS
to the C-64. I believe I was mentioning that, unlike the C-64, the
Atari could perform some functions without the need for processor

hungry RASTER INTERRUPTS.

Most of those wonderful "pretties" were not widely available during
the early years. Still, these items are a testament of the C64's
"staying power."

I have seen upgrades for the Atari that could bump that system up to a
full 1 Meg. Normally, since few apps took advantage of this extra RAM,
it was relegated to being a large RAM disk. The C-64's RAM upgrade had
alot more software support (ex. Berkley's GEOS).

>
>> >The C128 even had a couple of split-screen modes built into it's operating
>> >system.

So did the Apple II. Simple split screen display modes weren't
uncommon across multiple platforms. Even the Nintendo could achieve it
via processor intervention (despite the lack of a RASTER INTERRUPTING
FACILITY).

>> Yeah. I completely overlooked the C-128's new and improved BASIC. It

BASIC is also code. I assume you mean Assembly. Real programmers don't
even use that. Straight Machine Language is the way to go (numerical
OP-CODE memorization is very MACHO). After all, what's the sense in
programming if you can't go insane in the process? HHHMM?

>> That's 10 wasted machine cycles that the Atari doesn't doesn't need to

>
> Yes yes yes, but can you turn OFF your chips features any time you wish?
>or on even? can you tweak the antic? I remember not being able to do
>much... besides, irq is more flexible

You're going to have to be more specific. The Antic chip can be turned
off for either a blank screen (which increases the 6502's effective
speed because screen cycle steeling isn't occuring) or for direct 6502
processor manipulation of the GTIA (George's Television InterfAce)
chip. All the forms of interrupts on the C-64 are also supported on
the ATARI. Heck! If necessary, ANTIC could be set to display only one

single scan line (not very useful but interesting, nevertheless).
Also, don't forget that the Atari can also achieve overscanned
graphics (getting rid of those annoying black borders) WITHOUT USING
SPRITES!!!!!

>> >The hardware will take care of resetting the interrupt to occur at the new

>course and go into a cost cutting frenzy and instead of enhancing the systems

Curt... I'm lost here.... I absolutely DO credit Commodore with bringing down prices... ans starting that whole '8 bit' war...when that full page ad hit.. 64k at $695..(maybe $595).. that was absolutely unheard of... talk was brewing at every computer show as to how can they do it.... upgrading the 800 at that time cost almost as much..... remember?

>also ridiculously reliable. You never saw a load error. Ever.

I can't say that about the Atari... I kept the heads clean on the 410.. I replaced the resistors to get a 'tighter' read window... all of us.. I mean all of us know what it's like to hear a program load for about 15 minutes and crash within the last minute or so! Rewind and start all over!!!

Bell and Howell was trying to grab the changing AV market in schools. They had a large share of the 16mm movie projectors earlier. Of course, this was fading due to the introduction of video tape, in which they had a share, but not a major one. In the late 1970s and early 1980s they had done a few things with reading aids based on audio tape technology. IIRC, there was a device that used cards with pictures on them. A strip of magnetic tape with a recorded sound or word went on one edge of the card. The card went through a player that made the sound or word. It may have been expanded to phrases or sentences. I believe they made an offer to Apple to help with the education market when Apple began to smell even bigger profits in other areas.

There's something rattling around in my head about an outfit that provided AV equipment to some of the school systems near where I live. They were big into the Bell and Howell/Apple thing and had a contract with many school districts for tech support and maintenance on those black computers. I can't remember the name of the company, but at one time they were even hiring programmers (BASIC!!!) to produce their own line of courseware.

Of coure, you have to remember that Dorsett had done similar things in the Atari market, using a special cartridge and the 410 program recorder. I can't really remember which came first -- the Dorsett venture, the Bell and Howell/Apple alliance, or the first of the MECC projects.

My wife and I were both teaching at the time, and our kids were young. We used a 410 to load programs for almost a year because our money went into hard copy. I had an 850 and an Okidata Microline 92 almost a year before my first 1050. The whole system was set up on a bridge table (!) with a cable going to a Zenith 19" TV. When I got the disk drive, I also got a computer desk. It was made of particle board, as they all are, weighed a ton, and I took it into my house and up the steps in pieces. I was all alone at the time. Step one on the instructions:

1. Put up a pot of coffee and call a friend. Assembling this
desk is a two-person job.

I struggled alone, but it was worth every sore muscle. The disk drive was a wonderful step up, even though my family continued to use the 410 for its special qualities of simultaneous audio and data for a long time. And yes, Hangman was one of those tapes, as was SCRAM, the entire Invitation to Programming series, and a few others.

There's too may issues in this thread..so, I'll add my 2 cents all in one... (I know, who cares!)
I agree... the cassettes WERE brilliant in that it was 2 channels... the learning series(Talk 'n Teach) and the language series prove that... my kids liked them for that reason.. however, in this day and age.. they think it's the computer, not the tape, doing the talking!

Next... Curt, the Vic20 came out AFTER the Atari 4/800? Wow.. didn't know that.. I remember the Vic20.. was that, 20 column caps?????????? After seeing a friend with that, I HAD to get a 'puter...! I stayed up day 'n nite reading ads... 1980/'81???

Who's fungus? The guy pops out of a closet, throws darts, and runs back.. seems to know his 'stuff.... or DOES he?

While on the subject of Apple clones, here in Australia one of the
larger electronics shops (Dick Smith) sold the "Cat". It was a
non-Apple2 machine till you plugged an emulation cartridge into it.
It looked rather nice, sort of like a deeper Amstrad CPC464 minus
the tape player. About 2000 units were sold before Apple started
kicking heads in.

Zero crossing is supposed to be the most memory efficient speech recognition
system. It doesn't digitize the whole input wave, only the points at which
it ...um...crosses zero (couldn't think of anything more descriptive). The
templates can even be played back through something to approximate the
original sound. Maybe I'll just have to start from scratch with this
system. Here's a description crom comp.misc.robotics.

The limiters (op-amp's) are the hardware that ensures that the
zero-crossings
are seen as clean logic levels. The following is a brief description of the
software:-
After first detecting sound, the software samples the >1Khz - <1Khz inputs
every 160uS, and looks for a change of state from the last sample. If
found,
it increments a counter (two counters used). I did this sample - check -
increment cycle one hundred times, which takes 16mS. The counter contents
are
then processed into a 5 x 6 template memory array according to the
relationship
between the two count values (a specific array value is incremented). The
above is done sixty times (0.96 seconds), then you have a 30 byte template
of
the incoming utterance. In learn mode I average three repetitions of the
same
word, as you never say a word exactly the same every time, and this helps to
make the template more 'variable'. In recognition mode, the utterance
pattern
is placed in a 30 byte buffer and then compared to each template in the
required set. Best match and score threshold rejection routines decided the
recognisers output.
Interestingly, I have used some of the latest single chip recognisers, and
unbelievably obtained better results from the above.

Patrick Robbins

If you mean the acoustic 300 baud modem, we have one. Some benighted soul
threw it away along with an 800, 850 and some software. Anyone use
Typing Tutor?

We don't know if it works or not, but it looks in good
shape, with box, cables, power supply. Pay the shipping and it yours.

My address is nospam@erols.com, replace nospam with menkesjg.

Thanks!

This isn't specific to just those games, but I do think everyone agrees w/ me when I say this. Atari started out as a game company and lived on as a game company even when the home 'puter divison died.

Therefore, when it came to games, gameplay, and graphics for that time (1978-1990, hell even today) were THE BEST 8-BIT GRAPHICS for ANY 8-bit computer platform of that time (Apple, Commodore, IBM, even NES and SMS on some games).

However, early in the years, computer programmers weren't really all in tune as to how powerful the Atari 8-bits really were (except for MAJOR software corps.) and thus, even though the gameplay wasn't any less fun, the graphics weren't mind-blowing.

It wasn't until later on when users started fending for themselves (and the STs and Comm. Amigas came out) when the graphics and sound capabilites of the Atari really came through (1984-1990).

There are a multitude of cases however in the early years were games on the 8-bit computers can still compete w/ some of the graphic technologies of today.

One FINE example of this was JOUST for 8-bit (of course there was Defender as well, but IMHO, Williams did the best job for grahics w/ Atari just as LucasArts did. This next statement is pretty much true for all Williams games). When my dad bought me that game (I got it in 1991), it blew my mind away! I didn't play my NES for WEEKS. That game impressed me on how Williams knew how powerful the Atari 8-bits graphics were and took FULL advantage of it.

Now, of course, the disk games for the Atari 8-bit (because of mem. and space) were for the most part always pretty awesome, I made the above comparison for CART. games.

But sometimes there were exceptions even to that (later on in the years). One fine example is BallBlazer. That game was another KICK ASS GAME as far as graphics and sound for the Atari 8-bit (I had to put my NES on hold for a full MONTH on that game:) but the CART. version was even BETTER than the disk version.

You guys are prolly tired of hearing all this and I could go on and on but I am going to stop so you can reply away.

Laters,

ACK, I forgot to add that game in my original reply! Someone slap me!
Star Raiders was another example of an early Atari 8-bit game that truly
tested the graphic logic of the 8-bit. It was the first "true" 3D game
for Atari 8-bits (I think it also helped put the computers on the map).

No, there are plenty of BASIC add-ons and enhancements that are better
than BASIC 7.0 (128).

It was an awesome looking machine. Watch Batman & Robin (or whichever one has George Clooney in it) and the computer Alfred uses is that Mac. As to an e-mail reply that I got regarding the price of the 20yr. Mac being so low, I was mistaken, it was actually $1700.

I saw that at CompUSA. The only TOTALLY Apple computer store (as far as support and hardware) in Lubbock, TX (BestBuy stopped selling Mac stuff because of people getting sucked into getting IBM compatibles because they area a dime a dozen now, *sob*, including me)

Wishing he could afford a new PowerMac G3 (the one that looks like an iMac on crack)

Okay...

Summer Games was better on the C64.

All the LucasGames were better on the Atari, especially Ballblazer.

Pole Position was better on the C64 (didn't the C64 have rounded tires and
better overall graphics? or am I thinking of the 7800 version?)

I don't remember the others. Pretty much all EA games were better on the C64.

Was the Mimic advertised shortly after the C-64's introduction? I seem
to remember a C-64 item such as this advertised in various computer
magazines around 1983 but assumed it was vaporware.

Autoload and DOS are two very different things. The disk drive's
operating system is always fully loaded as soon as it is switched on.
However, the disk drive's operating system in this case does not support
autoloading. C'est la vie.

However, the computer doesn't look fried because it's not a "dark blue
screen", it's a dark blue screen with a welcome message, a prompt, and a
blinking cursor. Blinking cursors are generally regarded as "signs of
life."

Obviously, 25 million customers didn't find the lack of autoload to be a
real problem.

Actually, I know that at least one emulator includes sound for I/O,
(the well known beeps) however this is an optional setting.
None of the emulators currently support tapes though,
although APE does, if you want to put it an the emulator category.

988. FSK sounds on the Atari program recorders

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-23 00:00:00 UTC
From: ernest@wxs.nl
Message-ID: <36aa2ee6.2326330@news.wxs.nl>
Source record: 55913

Since everybody is talking about tapes again in this news group...
I am currently working on a follow up project to expand the fun of
tapes on the classic Atari machines. Two years ago, I wrote a program
to read in and process Atari tapes, so they could be stored on a PC's
hard disk. Right now, I am working on a program to convert these
cassette files (typically 16 to 32 K) back into a wave file, that can
then be recorded to an audio tape again, so you can load them
on a real Atari again.
Now here is my problem. I have almost finished writing this program,
but while looking at the output of the cassette unit, it looks like
the mark bits and the space bits are not the same length.
Is there someone familiar with the theory of the FSK decoder
inside the Atari cassette unit? I have noticed that it takes
three periods of space tone (3995 Hertz) before the FSK decoder
detects the space bit. And there are only seven periods in one bit.
I suppose it takes a while for the decoder to notice that the space
tone is gone, but I would like to know why and how this all works.
I have been looking at the bits with my oscilloscope for two weeks
now, and I am very much puzzled by the way the FSK decoder
behaves. This is not a problem if you write tapes at 600 baud,
which is the standard value, but I have been experimenting with
speeds up to 875, which seems to be the upper limit.
Is there anyone who can tell me more?
Do specifications for tapes exist, other than the frequencies
and such that we all know from De Re-Atari?

Keep those XL's/XE's humming.
Please help me help you!!
Ernest.

You should try getting a hold of these:

1. Atari Technical Reference Notes, one volume has a full O/S listing (ROMS).

2. Atari BASIC Source Book, by Compute Publications, has a full listing of the Basic cartridge and text to explain how it works.

3. Inside Atari Dos, by Compute Publications, as above but covers the DOS for that system.

Good Luck.

If nothing else try finding someone who's selling the cartridge, or better yet the MAC/65 cart by OSS. No loading time, yippppe!

It's a type of network. The MUX (which is short for multi-plexer) package he's talking about contains one "master" cartridge (for the computer that has the hard drive attached) and two "slave" units (for other computers). The "slave" computers can now access the hard drive on the "master" unit.

When you hear master, think server.

One of the main reasons this would be useful for 8-bits is having 7 slaves with modems: instant multi-line BBS.

Atari users are smarter than that Commodore trick of lead fishing
weights. All they had to do is screw the Atari to the table and it
becomes much heavier than the C64 ever could. (the C-64 couldn't
easily achieve this trick because of the slit air vents running
throughout the bottom of the case. This was probably a cost cutting
measure to reduce the amount of plastic used in a C-64.)

Of all the Atari vs. Commodore messages, this has to be the by far the
dumbest! AND I LIKE IT!!!!!

996. Re: Atari Program Recorders

Remember HANGMAN for Atari on cassette? I remember I would trip out
hearing voice recordings and music while the game would load. That is
still pretty damn cool considering how long ago that was.

The beeping sound of the Atari Disk Drive was VERY pratical. You could
tell how the drive was acting by the beeps and sounds that came through
the monitor/TV speaker. It also sounded pretty neat. Reminded me of
galloping horses when a program was loading up correctly.

Remember last year (or 1997) when Apple released the 20yr. Mac? The
starting price WAS $10,000. Then it went down to $5,000, then $3,000.
As a matter of fact, I saw it the other day for $1500...BRAND NEW. It
was mostly designed for show anyway since it is virtually IMPOSSIBLE to
upgrade.

Not really. The Atari's DOS load occured AUTOMATICALLY. No "ARCANE"
instructions had to be typed before DOS (or any other program) would
load. This was a MAJOR headache for three separate families I
personally helped (one being cousins) that bought their C-64's at
their local toy store and couldn't figure out how to load a damn
program. Of course, you could say they should have read the
manual...but who wants to be forced to read the manual just for the
rudiments of something that should happen AUTOMATICALLY! One of these
families actually thought the C-64 was damaged and returned it for a
replacement.

Atari's, on the other hand, were lovingly made for idiots (in a good
way). I guess you could say that the ATARI was the IDIOT'S computer.
Wouldn't have that been a wonderful TV advertisement.

The Atari SIO serial port could handle up to 19.2Kbits per second.
This, of course, did not mean Atari drives achieved this speed.

>past "known limits".

The upper limit of a computer may be significantly extended by great
programmers (the kind of people that Microsoft lacks), but they can
only go so far. For example, DOOM or WIPEOUT would be impossible on a
standard C-64. Fluid 60 fps full screen (especially horizontal) fine
scrolling is impossible on an original Atari ST. Still, one of the
most fun things in life is to tinker with a computer and accomplish
things that people said COULDN'T BE DONE. Heck, one of my singular
achievements that I remember with fondness was to develop a special
mode that increased the number of colors on the Atari's high res
(320x200) display via the use of triple width sprites (without the
need for DLI's or RASTER INTERRUPTS). This is a mode that I don't
believe anyone ever incorporated into an Atari program.

The MAJOR problem you are going to have is making the program to make
the best mem. usage. On my COVOX, it would take up LOADS of mem. just
for a 10 sec. phrase. I remember how I used to hook up the COVOX to my
stereo to give my Atari 800XL stereo suround sound. That kicked ass
playing the intro. of Alternate Reality or going through warp in Return
of the Jedi.

That's the same reason why SCSI never caught on in the PC community.
Instead, we're left with that god awful IDE standard. That same
mentality is now making HST "software modems" popular.

Actually, I've just started browsing the computer magazines of that
era and haven't seen a significant difference in price between Atari
and Commodore peripherals.

I want to point out something here. I own an Atari 800 and have used one emulated as well, and despite an "autoloading DOS" I have no freaking idea what to DO with the options in SpartaDOS or MyDOS or AtariDOS. So, I need to look it up...which is what someone who wants to learn how disk operations work on a 64 has to do, too.

Thanx for the compliment. My article was a bit of a rush job and in no
way was meant to be the "end all, be all" of comparisons. Still, it
was a lot longer than I expected when I wrote the very first sentence.

When the Ataris first came out, Commodore had already been established
as a "business" computer retailer via the "PET". Strangely, the
ill-fated Apple III, introduced in either 1980 or 1981, looked alot
like Commodore's wedge shaped "PET". Wonder if this was a conscious
decision by Apple?

Douglas Newbaur (have I spelled the name correct?) was one of those
responsible for POKEY and SIO. He also wrote the astounding STAR
RAIDERS. In an article in either ANTIC or ANALOG magazine, he claimed
that the Atari's were originally intended on having a parallel bus
but, I believe, Atari wanted to rush the computer to market (in time
for the Christmas rush?) and opted for SIO only output. If he had
known of this plan, he would have incorporated two separate SIO ports.

Is Doug Newbaur one of the patent holders of USB?

In terms of upgradeability, the C-64 suffered a similar set of
problems as the Atari 8-bit line. For example, the C-128 (the only
major Commodore improvement of the C-64 compatible line) contained two

separate graphics chips, the first being the VIC II (with its various multi-color graphics modes, fine scrolling and sprites) for compatibility with C-64 programs, and the second for 80 column text only display. Only one graphics chip could be "on" at any given moment. Also, the VIC II chip had to be put to sleep if one wanted the C-128's full 2 megahertz speed (double that of the C-64). With the help of the original Atari engineers and Atari's full backing (yeah, right), I don't see any reason why there couldn't have been a SUPER ATARI 8-BITTER. Unfortunately, the original Atari (Warner) was too stupid and Jack Trameil was more interested in coming out with an incompatible 16-bit line (containing god-awful graphics, sound (same chip as the Intellivision), cheap mouse, and an extremely slow GUI via GEM).

And don't forget that Apple didn't want to invest much time in
upgrading the Apple II line. Instead, they wanted to use a portion of
the profits to finance their then new Macintosh line. The clone
manufacturers single-handedly forced Apple (kicking and screaming) to
come out with better II's (IIGS, IICplus).

As far as I'm concerned, the Laser series of Apple II compatibles were
the best (especially the 128ex and 128ex/2, which ran at up to 3.5
megahertz and had keyboard switchable speeds without requiring a
reboot and an internal RAM card which was upgradable to a full MEG via
inexpensive DIPS).

Just read your article. It was quite good. However, I have a few
(minor) bones to pick with you:

1) Too repetitive with the Ultima series (one paragraph discusses
collecting a specific game series, Ultima, across the various
platforms and then, a few paragraphs later, Ultima is again mentioned
in terms of values).

2) The use of the term "PC" is flawed. The article should include
games for the console (keyboardless) machines such as the Atari VCS,
Intellivision, Colecovision, Nintendo, Sega, etc. Many console games
had a major influence on computer gaming (and vice versa) and I
consider such an omission to be highly flawed.

You are a complete nerd aren't u? well, an mere 256 increments in pitch
is kinda lame don't you think? 65536 is much better.

What the fuck are you talking about?

simulate? excuse me? the c64 has RASTER irq's right outta the box ,
NmI's too, and we got 64k ram stock, + I have 512k reu, I knw other got
2megs +! I also got a supercpu 20 mhz accelerator? think your wimpy atari
can keep up?

The manual was unnecessary for getting started with the Atari. For
copying disks, I briefly read the necessary part of the manual for a
total of ONE TIME throughout my initial 5 years of use on the Atari.
In comparison, I was always referring to the Commodore manuals for the
simplest of tasks. This was, to say the least, DAMN ANNOYING!

It's really too bad; it's killing the usefullness of the newsgroup.

There were 106 new messages when I got on today. After I deleted the pissing contests, 24 messages were left.

And much of the rest was leftover crossposted crap from the Dr.Who thread.
Oh, well. The newsgroup was fun while it lasted...

As far as I know the 64 was never cloned, due the PLA was a closely
guarded secret as to how it was programmed...

I never saw one in the states anyways... besides 6510, 6569/6567, 6581
were all propriatary chips made by M.O.S Technologies (Commodore owned)

Sorry you feel that way Jeff. Personally, I have learned quite about from the posts comparing Atari to the other platforms. I guess not all of us have the same level of expertise that you possess.

I say keep up the good work NG!!

Well it is my opinion computers should NOT be simple enough for
everyone to use without reading at least SOME type of manual... it then
ceases to be a computer, and becomes an appliance... something the big
wigs are really pushing for... and it's totally wrong... I want a
computer, not an appliance!

If your so destined to have everything so simple, go buy a damn web tv or something! Computers are OBVIOUSLY not for YOU! You want an appliance to do everything easy and for you... well... I wanna USE my computer, not it USE me! Thank you very much!

On that line of thought, we will end up with all the same boring machines, that do everything, and no FUN to HACK! (Hardware, software, otherwise?!) This is not my idea of a good time!

Sorry. my 128D's keyboard, kicks ass over anything, even new pc
keyboards! I hate them!

That's a bummer, they made great games for the 64, Amiga, and tg16 (pcengine), NES, SNES, SEGA, etc etc :) Check this game out on the 64 if you get chance, it is very visually impressive, as is Mayhem In Monsterland (from Apex) Or creatures 1 & 2, go check these games! :)

Ahh, this brings me another point actually, can any of the Atari users out there say they have over 3 gigs of games, and no two are the same? :)

(and that's pkzipped disks!)

I didn't mean to imply I'm such hot stuff, merely that the _vast_ majority of messages in those posts were about things that were personal preference: keyboard layout, DOS loading mechanism, etc.

If you were lucky enough to find answers to certain questions you had by digging through all that "Nuh-uh! Yuh-huh!" crap, congratulations. But it was clear that most of the posts were the "X is better than Y because I like it" variety, which will never be reconciled and simply eats bandwidth that could be better used for pornography spam.

You're clearly right, but it's like prisons and waste dumps. Everyone knows they have their purpose, but no one wants one in their backyard.

I also hate the cross-posting aspect of it. There will be splinter threads having nothing to do with Ataris hanging around for weeks just because too many people refuse to check where they're cross-posting when they reply.

Hey, I'm just venting _my_ spleen here, right? Defend _me_, mofo. (Sorry about that. Watching Robin William on the Richard Prior special, and it just slipped in somehow...)

> about all of 1k programmable memory? :)

I used to have a TRS-80 pocket computer. There wasn't too much I could do with it, though. The screen was an LCD that displayed only one line of text. I don't recall how much memory it had.

All I remember was that I wrote a small calendar/appointment/phonebook program in BASIC for it. The program was so big that I had no room for data. So, I eliminated the phonebook capability and stripped out some other features to make more room. To say the least, debugging anything when you can only see one line of code is an arduous task.

Well, I got everything shaped up pretty well after many hours of hard work. Then one day, I left it sitting on a bench. Someone sat on it. OK, it was my fault, I should have put it in my *POCKET* instead of on the *BENCH*, but all that right now is "coulda shoulda woulda".

In short, yes, I do remember the old pocket computers.

I also remember one-topic BBS's on which everyone talked about everything but the topic and had a blast doing it.

I remember when 1200bps modems reigned supreme. Ahh, hell, don't get me started on that!

Here is how to read the keyboard on a C64:

JSR GETIN

Pretty tricky, eh? If it returns zero then no key is in the
keyboard queue. You can even use

JSR CHRIN

to read in a whole line of text ala INPUT.

>Paddle (joystick) read routines are somewhat more involved requiring
>some kind of countdown routine I can't remember.

The super-complicated C64 method of reading the joystick is:

LDA $DC00

Whew! Bits 0-4 correspond to up/down/left/right/fire for joystick
number 2.

>>(Paul Guertin)
>>Was the Apple II the only home computer of its era to have a monitor
>>in ROM? I started on an Apple II and couldn't understand that other

The PET has a built-in monitor.

Again, I'm not understanding something -- what do you mean by
"a form of 3D"? 3D calculations are 3D calculations. As near as
I can figure out, you are referring to the final rendering --
be it wireframe, solid polygons, or texturemapped. I for one
do not equate "texturemapped" with "3D"; indeed, as near as I
can reckon, games like DOOM aren't even really 3D at all.

More to the point, I believe 3D games can be quite fun without
being texturemapped. Is that not the purpose of a game, to be fun?
Thus I happily stand by _my_ statement: the 8-bit machines are
quite capable of doing high speed 3D games/programs.

Certainly. But the argument being given was "The C64 version of
Rescue isn't very good, therefore the 64 isn't very good."
Which isn't a very good conclusion.

I was not clear; I was asking from a programmer's perspective,
i.e. programming pokey from ML. I am trying to understand your
comment vis. SID being "significantly harder to program".

Yup, that's all you need.

>> Tony, it'll send it to the screen unless you've told it otherwise.
>
>Loaded question maybe, was this CHROUT routine in ROM or a RAM vector?

It is both. CHROUT is set to $FFD2, which is in the kernal jump
table in ROM, which contains the following line:

JMP ($0326)

$0326 is located in RAM, and points to a ROM routine.

Furthermore, the same routine is used for outputting characters
to any device. For example, to print to the printer instead of
the screen, you'd use

```
LDA #4
TAX
JSR SETLFS
JSR OPEN ;Open a channel to the printer
LDX #4
JSR CHKOUT ;Make it the output channel
```

Similarly, you could open a disk file and redirect output to it,
etc. The output routine CHROUT is, of course, smart about the
device it prints to, so for example, if you print the "cursor up"
character to the screen, the cursor is moved up. Print it to
a file, and the byte is simply output.

...without "diverting the vector"...

>There isn't a KERNAL routine to output a string of characters.

There is on the 128. Otherwise, it's awfully easy to roll your
own, for example,

```
JSR STROUT
TXT 'Hola Robin',0d,00
```

>The C64 also has a housekeeping routine that is called 60 times per
>second - it does things like read the keyboard etc. - and likewise,
>programs could add to or replace this code. Believe it :)

On the Atari, every keypress generates an IRQ, so it doesn't use
a keyboard update like the 64. On both machines, the decrease in
system speed is negligible, though.

More to the point, few people are able to use software without
reading the manual, and the first line of any 64 manual says:
"To load program, insert disk and type ..."

For the home market, the autoboot feature is pretty superfluous.
On the other hand, I do think that this is the kind of "professional"
detail that kept the best selling home computer out of the business
market...

Those last two sentences don't exactly match :).

>doesn't actually run a application though unless it is called
>AUTORUN.SYS or STARTUP.BAT in case of SpartaDOS. The C64 also needs
>to load in a DOS in order to use disks, it's just that it loads it in
>from ROM inside the drive?

Not quite -- the DOS is _in_ the drive, on a ROM. The disk drive
is a programmable device, with RAM, ROM, and a 6502. When you
send a DOS command -- to rename or scratch a file, to format a
disk, etc. -- you send that command to the disk drive. The disk
drive itself exectues the actual command -- C64 users could do
something else while formatting a disk long before the Amiga ;-).

By the way, this feature is why old programs work with new hardware
on the 64. The 64 program doesn't care if it is talking to a RAMdisk
or a 1541 or a SCSI hard drive -- it just tells it to scratch a file,
and the individual drive does the rest. The program itself does
not need to be updated with any sort of device drivers.

This is also what makes fastloaders possible -- a special program
is loaded into the disk drive as well as the computer RAM, and the
two programs talk to each other.

Make sense?

> A-U-T-O-L-O-A-D!!!!!!!!!!!!!!!!!! Who whouda' thunk!?

Well, no, Commodore's do have a type of autoload. There are three
variants.

Stock C64:

- AS all people should know, if a key has two things printed on it, the
upper thing printed indicates use of the SHIFT key. There is a little
key on the extreme left of the keyboard, second from the bottom, that
says: hey, whaddya know, RUN. It also says STOP under neath, so press
SHIFT+RUN/STOP, and VOILA! It works.

Of course, this is for TAPE. Commodore didn't make the feature for
drives, but you could type:

LOAD "*",8,1:<shift+run/stop>

And it would also work. Remember, Commodore was very tape based at the
beginning. (Someone correct me if I'm wrong).

C64 with Addition:
SuperSnapShot allows autoloading from disc. Just let the menu sit there

for a few seconds, and it gets the idea. Granted, the disc has to be "prepared" to autoload, there is a second read into memory I believe.

C128:
D'uh, BOOT. Put a disc in the drive, turn on the C128, and it boots itself.

Of course, there are also CARTRIDGES. They "AutoLoad" as it is, just plug in and play. It depends on your medium. I for one do not like CD-ROM's autobooting once I put them in my Macintosh. I would dislike the feature even less on the CBM. It takes away control from the user, which I don't like.

Identical pieces of music? I suppose the sound of one computer could reasonably (but not exactly) be emulated on the other. But why not concentrate on trying to make two completely different computer systems mimic each other when it's more beneficial to concentrate on each computer's separate strengths? You wouldn't want your wife (if you have one) to magically grow a d*ck...just to prove she's just as good as you.? Would you? Hhhhmmmm?

That's really not much of a problem! Just put it in your knapsack,
with your monitor and power supply. :-)

How did you arrive at the 25 Million mark? My information was based on
Commodore' 1993 Annual report which stated a total of around 17
Million sold. An additional 8 Million seems way too high for a company
that went bankrupt shortly afterward (and a computer that was at the
end of its run, anyway).

I've missed most of this discussion, but who
makes/made a 35X fast loader? European?
I've got most of the fast loader cartridges
sold in the US, and none remotely approach
this. I'd be interested in purchasing one if I
could get some manufacturer's data on it.
Still being made?

> computer platform of that time.

Let's check out the real facts and not be so biased...
First of all, let me tell you I'll always like my Atari more than any other computer (it was my first video gaming experience in 1984).
Still, without being the devil's advocate, some of you really have to know that, due to many reasons, the Commodore 64 REALLY outpowered ANY other system, Atari 8-bit included, with some mindblowing games.
I don't like emulators much, but if you can, check out Mayhem in Monsterland on the Commodore to check out how far behind the Atari can be (this is just an example, some other "recent" games are also masterpieces that, sadly, few Atari programs have equalled).
When you say the Atari has "THE BEST 8-BIT GRAPHICS", this only applies, unfortunately, to Ballblazer, some titles from Zeppelin Games (Draconus, Zybex...),
a big part of the Polish programs, the Columns clone Line-Up and three or four other titles (I don't count demos).
On the other hand, the Commodore 64 has an overall quality in the graphic representation of its games (which, of course, doesn't mean that all the games look great).
Note that the programs from Zeppelin Games are just C64 conversions and that some Polish games have ripped graphics (compare Operation Blood on the Atari and Operation Wolf on the C64, you'll see what I mean).
My conclusion: the problem with the Atari is that a vast majority of people (except Polish/Slovak coders) program it like in 1983, while Commodore coders always want to push the boundaries of their computer.
This is why I feel the Atari, sadly, has a lot more to prove.

> However, early in the years, computer programmers weren't really all in
> tune as to how powerful the Atari 8-bits really were (except for MAJOR
> software corps.) and thus, even though the gameplay wasn't any less fun,
> the graphics weren't mind-blowing.

Agreed.

> It wasn't until later on when users started fending for themselves (and
> the STs and Comm. Amigas came out) when the graphics and sound
> capabilites of the Atari really came through (1984-1990).

Still, like I said, MANY Atari 8-bit programs looked like VCS or TRS-80 stuff.
On the other hand, C64 owners either got multi-platform conversions or great coders who would program games with a lot more depth or better graphics/sound

than the usual Atari crap.
Not forgetting that we're talking about something like 1 Atari release for 40
C64 productions some ten years ago.
No exaggeration, just the facts.
Unfortunately, that leaves us with few really good programs on the Atari at
that time.

> There are a multitude of cases however in the early years were games on
> the 8-bit computers can still compete w/ some of the graphic
> technologies of today.

> 1991), it blew my mind away! I didn't play my NES for WEEKS. That game
> impressed me on how Williams knew how powerful the Atari 8-bits graphics
> were and took FULL advantage of it.

Confusing...
Atari bought the license from Williams and programmed the game on the 8-bit.
Joust on the Atari 8-bit taking full advantage of the computer?
You can't be serious...
I agree it's a very cool game with fun effects and fantastic gameplay, but
that's all.
The graphics are pretty good (they do their job), but not mindblowing.
Did you see any NEWER stuff at all on the Atari?
By the way, Defender on the Atari 8-bit was coded on an Apple II...

> Now, of course, the disk games for the Atari 8-bit (because of mem. and
> space) were for the most part always pretty awesome, I made the above
> comparison for CART. games.

Sure, from 1980 to 1984, they were probably the best, until the advent of the
C64.

> But sometimes there were exceptions even to that (later on in the years).
> One fine example is BallBlazer. That game was another KICK ASS GAME
> as far as graphics and sound for the Atari 8-bit

Agreed.
That's because people really worked hard on that project.

> but the CART. version was even BETTER than the disk version.

Nonsense.
The cartridge version is a straight port of the ORIGINAL disk version (with
animated intro) and is probably 32K or so.

Hmmm, you see, this was the C64's "flaw/feature", that helped
millions of users to be programers. And damned good ones too.

You must be a Win advocate, where the user remains as dumb as it
can get. Simplicity....you call it.

It's a special anniversary edition of the Mac. It looks like one of those expensive stereo systems with exotic names. Quite nice, actually.

I saw my first one in the window of a used computer store a few months ago, but the owner told me it was not for sale. The keyboard was very small and reminded me of the original Mac's. I have no idea what's inside the case. Probably nothing of significance.

What Apple should do (but won't, there is no market for it) is release a 25th anniversary edition of the Apple II in 2002. Put one of those mythical GaAs 500 MHz 6502s in it (anyone else heard about this?) and let it fly!

So, if I get an Atari right now, how would I know that I have to
turn the disk drive 1st, then insert a disk in it, and finally
turn on the computer, in order to accomplish this "autoboot"
process?

I have a Commodore128 which sports autobooting.... Almost never
use it, unless it's a certain software that I want.

IIRC, every Atari 8 bit made right down to the lowly 400 with a membrane
keyboad comes stock, right out of the box, ready to run the serial buss
at 1.79 mhz.

Two problems with this of course, no devices you hook to the serial buss
could run that fast & a 1.79 mHz clocked 6502 can neither supply data to
the serial chip that fast nor digest it that fast.

Ditto for anything you could do with a C64. Eventually you run into the
problem of counting machine cycles. There are only so many LDA
SOMEWHERE, Y; STA SOMEWHEREELSE, Y; INY Y; BNZ SOMEMORE you can do.

This is one of the things I have trouble making even seemingly good
programers understand. Somehow there seems to be this false impression
that *IF* only they hook up an IDE drive that can transfer 2 megs/sec to
their computer, they will get 2 megs/sec load times. Patently false
assumption.

Poor analogy maybe, but think in terms of a machine gun that fires high
velocity/low bullet weight ammo & low velocity/high weight bullets.

Now the rate of fire for this theorectical gun is 600 round per minute.
That is it, period, end of story. The bullets from the different ammo
may travel at different speeds, but the machinery delivering them still
maxes out at 600 rounds a minute.

What the serial speed argument always degrades to:

Atari; "We can run our serial buss as fast as the processor can digest
the data."
C64; "Me too."

Which should surprise no one. Clock cycles are a physical constant,
maybe not quite on the same level as the speed of light, but certainly
in the same catagory.

A 6502 is a 6502<sic>.

In defense of the Apple II (coming from a Commodore junkie), the disk
I/O routines are probably the best of any of the 8-bitters.

No, the Plus/4, C-16 and C-128 had them also. I'm sure lots of other
non-commodore computers had them as well, since it's such a useful thing
to have.

Geoff!

: it's manufacture.

Illegal knockoffs appeared in Eastern Europe and Asia during the last 10
years or so. No legitimate clone ever competed with the 64.

Hello

I'm looking to purchase Alternate Reality The City and The Dungeon for the Atari 8bit. I want the original games, not ROM's to play on an emulator. Would prefer to have instructions included but will purchase the original disks if that is all that is available.

If you have a copy of either/both the Alternate Reality games For Sale (or know someone who does) please Email information to "ComDungeon@aol.com".

Thanks in advance

Al Horton

I think it's pretty clear that the incomplete 64 emulation in the 65 was a result of its pre-alpha state, not the fact that it was "impossible" or in some way would not have been completed.

It was cancelled because no Commodore sales unit felt they could sell them, and they were probably right, considering where the rest of the market was. Still, the 65 is a wonderful thing to look at and dream about. I take mine out for that very purpose every so often. That, and for the 3.5Mhz 64 mode. :)

Yep. Locksmith 5.0 could copy a whole (unprotected) disk in just 16 seconds, if there was enough RAM to do a 1-pass copy. On my 128k Apple IIe, it had to do two passes so it took about 18 seconds, but that's still pretty fast. I usually did a verify after write, which added another 8 seconds or so.

Nibble magazine once published a program to store hi-res pictures in a special format (one big 4k sector per track instead of DOS 3.3's 16 256-byte sectors). It could load a picture (8 kilobytes, two tracks) in about half a second (faster if the drive was already spinning), which allowed for simple animation (loading page 3-x while displaying page x).

> LDA $C000 :read the keyboard
> NOTE: the keyboard wasn't pressed if bit seven is clear.

After reading, you also had to access $C010 to reset the keyboard. Keyboard reading was easy and programmer-friendly. Later models (starting with the enhanced IIe, I think) added an "any key down" flag somewhere in the $C0xx area.

> Paddle (joystick) read routines are somewhat more involved requiring
> some kind of countdown routine I can't remember.

I can't either, but you got the gist of it. You also had to wait a while between paddle readings, making the task non-trivial for arcade games. Then someone came up with a way to read both paddles (joystick axes) at the same time, and things were nicer.

> The Apple monitor was nice to have around. Unfortunately, I believe,
> Apple was a bit wishy-washy on implementing it on some Apple II
> variants.

The monitor (including the very useful disassembler) was included in every Apple II. What was missing from the IIe and early versions of the IIc is the mini-assembler (and other, less important things). It was put back in the IIc when they doubled its ROM size.

On the Apple II keyboard, RESET was just above RETURN, and in those days when you pushed RESET, you lost whatever Basic program you had in memory. After a few such incidents, many people removed the RESET key, or put a small washer under the keycap to make it difficult to press accidentally. I believe Apple issued official instructions for this.

On the II Plus, Apple added a switch on a daughterboard that allowed the user to require CTRL-RESET instead of RESET, to the relief of many.

In my opinion, the Apple IIe keyboard was one of the best keyboards of all time. Great touch, nice layout, good quality. If only the arrow keys had been in an inverted T instead of in a row, it would have been almost perfect.

Early models of the Apple II (we're talking 1977) required the user to type "6 CTRL-P RETURN" in order to boot (from slot 6). On very early models, there was no power-on reset circuitry -- the user had to push RESET after turning it on.

The market was mainly in Asia, I believe, and there are some ten
(physically) different non-sanctioned clones out there. I've never
seen one though, something I'd like to rectify.

No, Psygnosis being an English company and a fairly late startup they
missed the UK Atari market by a couple of years. Similarly, companies
like System 3 and Thalamus, the mainstays of quality C64 software both
only supported the UK big three 8bits and then tailed off to the C64
before going 16bit only.

Anybody who thinks they can work a "real" computer without previous
knowledge or the manual is an idiot. Period.

I know you're talking about the simplicity of a machine being important
(something I consider a bit rich from the fan of a machine that gives
numeric error messages...) but I *don't* think it should extend to
removing the *choice* from all users. I *hate* autostarting, it narks
me off when '95 starts a CD up on it's own, if I just wanted to grab a
couple of files I have to shut the bloody thing *down* again. I don't
like sacrificing *my* control over a machine so that some pleb can load
the latest no-playability "blockbuster" game.

On a C64 *one* command, LOAD"*",8,1 was all these twonks needed to know,
if they *really* couldn't memorise twelve characters they could *write
it down* on the case of the machine with a marker pen or something. I
don't expect the books I read to be about a dog called Spot and a large
ball and I don't expect the television I watch to be castrated to the
point where it becomes an insult to my intelligence.

So why should my computer be any different?

> Loaded question maybe, was this CHROUT routine in ROM or a RAM vector?

It's a RAM vector - points to ROM, but of course can
be diverted to your own routine.

The nifty thing about it is that all 8-bit C= machines use the
same jump table - it's called the KERNAL - so any program written
using only KERNAL routines will work on any of the machines -
from the PET through to the C128.

By default, CHROUT writes to the screen. If you open a file
to, say, a printer or disk drive, you can then divert output
to that file.

There isn't a KERNAL routine to output a string of characters.

The C64 also has a housekeeping routine that is called 60 times per
second - it does things like read the keyboard etc. - and likewise,
programs could add to or replace this code. Believe it :)

Likewise, PETSCII, the keyscan codes, and the screen display codes
are all different on the C64.

1072. AC Adapter Question

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-24 00:00:00 UTC
From: "J.B." <xstatic_27@usa.net>
Message-ID: <917205563.333877@nntpcache1.nortel.net>
Source record: 55725

Hello!

I recently inherited an old Atari 800 from my neighbor down the street, and I had a couple of really quick questions/things to make sure that I'm thinking right about.
I read the FAQ for the group, and I was a little confused about what kind of AC adapter to use with the computer (I just got the computer in the deal... NOTHING else!). I saw that the FAQ went over the actual power supplies used in the Atari 8-bit computers, but I was just wondering what to use as the actual connection to the wall (i.e. If I bought one of those "Universal" AC Adapters over at Wal-Mart, what I should I adjust the little voltage and polarity settings to?). I know that you probably don't have to be an electrical engineer to figure it out, but I just wanted to make SURE that I didn't blow something up. :-)
Also, really quick, I'm assuming that any old RF switch will work if I decide to hook the computer up to an old TV, right? If so, I'll just go drag one off of an old Nintendo or something... :-)

Thanks so much for any help that you can give me!
J.B.

```
>
> FLD = Flexible Line Display, VSP = ??? (someone clairfy, veriticle
> screen positioning??).

Variable Screen Position

It is a combination of anm FLD with a Wanker-routine.
FLD pushes the screen down as much as you like it in 1 pixel steps, by
just stretching the line-distance of the first line to the upper border.
A wanker pushes the screen to the right side as much as you like, by
delaying the time to build up the first textline in x-position.
Both make use of the $d011 register. The wanker needs the $d016 (x-
softsroll) to finetune the x position, that can only be adjusted by 8
pixel steps in X-direction using $d011.

No, it may not have enough horse power.

Atari 800s run on 9VAC. I have been telling people to use 9VAC at 3 amp
transformers for years & no one has come back yet to say I ruined their
computer. It seems like you want at least 1.2 amps minimum & may get failures at this
level. Most wall wart transformers
are not able to deliver this much.

OK, because the Atari has both a RAM vector and a ROM vector, but the ROM vector is considered poor form since the OS has gone under a number of revisions with the vector moving.

Atari does have a similar function & it is automatically opened for several devices on start up. There is a handler address table consisting of Printer, Screen, etc that is downloaded to ram on boot. The device table consists of single byte device ID with pointers to the vectors in any given version of the ROM. The table include vectors for open, close, put, get, that kind of thing.

You can dynamically add or remove devices by putting their handler in ram somewhere & adding an entry to the handler table, but I assume C64 has the same feature. Both seem brighter then DOS or GEM machines on that count. I really hate all those reboots!

Goal for Atari was device independence. To achieve this they implemented channels. All things being booted and set up properly, you can for instance have channel 0 open for screen, channel 2 for printer, channel 5 for a null handler.

In operation, if you wanted to output a byte to any or all 3 of the devices, you would just have the additional overhead of loading the X register with the channel number then JSR CIOV. Central Input Output Vector.

Concept was something along the lines of instead of having 20 different ways of accessing 20 different devices, you have one vector with smart handlers that know what to do with the data. That is, in the above example it is LDX #0; JSR CIOV to output a byte to the screen, LDX #5; JSR CIOV to output to your user coded null handler.

You can even cheat a bit on this if you want & just assume that channel 0 is open for the screen since it is the first thing loaded in the boot process.
You can also find the put byte routine from the vectors & jump directly to it vs using the channel number and CIOV. Bad form to do this, but I do it myself.

Yes, but (get this) only eight data bits are connected to the bus. What a waste! The TMS 9900 was put to very bad use in that platform.

The Tomy Tutor and Geneve 9640, derivatives of the TI-99/4A, are based on the later TMS 9995, which has 256 bytes of onboard RAM (sort of like a chip level zero page), and are not thusly crippled.

Actually I don't know either! This is the first I've heard of such a fast serial loader.

> could get some manufacturer's data on it.
> Still being made?

Judging by it's speed, I'd say it's a brand new system - most likely it is software based, which means you'd just download the program or purchase it on disk.

I'd also like to know more.

Speaking about Bounty Bob Strikes Back, does anyone have/know where a working C64 image/binary of this game is? I've tried to get it off of Arnold a few times, and each time it's been corrupted. Thanks.

> full 64K(?) for a full 640x200 color bitmapped display (possibly even
> a mono 640x400 interlaced display).

Without a hardware hack, it can also be done.

A company (Soft. Support Int'l?) used to sell a plug-in internal upgrade that gave you the 64K video RAM.

The C128-DCR (sold in USA, metal case, cost reduced integrated motherboard w/1571 controller, internal 1571 drive) included 64K video RAM by default.

The flat 128 (the original that looks like a C64C) has 16K, while the European C128-D (plastic case, fan, flat C128 and 1571 motherboards, and internal 1571 drive) came with 16K in some models and 32K in others.

With 64K, graphics displays can be pretty large and detailed.

A typical 16K display, for comparison, can do 640x200 monochrome or around 640x176 in color (8x8 cells, like the C64 hires screen)

64K can do 640x400 with 8x8 color cells, as with I-Paint. This is equivalent to taking two c64 hires screens, setting them side by side, and then interlacing 2 more side-by-side displays. (i.e. color cells are interlaced as well, allowing them to be mixed).

It can also do things like 640x600 with a program called "Disp/Lace", which loads 6 Doodle! format pictures (c64 hires color displays) and displays them all at once.

Also, there are displays such as the 750x720 monochrome mode which is used in one VDC demo. This mode uses the entire visible display, with no borders.

It is possible (or at least, it should be), to do a 640x402 display with 8x1 color cells. This would result in an 80x400 matric of color cells, each holding two colors. If you wanted to use this mode for APA (All points addressable) display, you'd display a 160x402 image. Each "pixel" of said image would be 100% unique, and not affected by any other nearby pixels' color settings.

This mode would be ideal for a WWW browser. Use the full 640x402 resolution to plot text and low-color-detail graphics (i.e. the GUI display, various system-provided Icons, and so on), and reduce all images to 160x201 resolution.

Displayed at 160x201, you can mix colors to provide a maximum of 136
apparent on-screen colors, with each "pixel" being completely unique and
separate from all others.

>
>One more thing, 16 colors on a text screen, and an ADSR wave on the

Not on a text screen -- on all screens. _All_ C64 screens are,
in essence, 16-color screens.

>voices aren't enough to convince me that the c64 is a more advanced
>computer...

Hmmmmm... perhaps I am simply dense, but which part of sprites,
color RAM, SID, twice as many characters, and so on is the part
that makes the C64 less advanced?

>they're nice, and have their place, and there are workarounds
>for that on the atari, but not enough to make a difference to me...

What workarounds did you have in mind for sprites, for getting
16 colors on the same raster line, for playing different waveforms,
or for timer-based interrupts? What effect would a given workaround
have on the system or program performance?

My point being that these are not merely features one can use in
an argument -- these are features that one uses frequently in programs.
Before I label a feature "useful" I try to name 5-10 different programs
which utilize the feature; in this case, I'd say perhaps 99% of all
C64 programs use at least one of the above features.

-Steve

> Loaded question maybe, was this CHROUT routine in ROM or a RAM vector?

Both.

CHROUT is a routine in ROM, with a vector in RAM to allow it to be
redirected.

However, to send data to another device, you simply issue a few commands to
the Kernal, using the stock CHROUT routine.

That is, you do NOT redirect it or supplement the CHROUT routine, you merely
tell the Kernal to send the data to a different device.

You could, but there wasn't a SID register labelled "voice 1 volume" or
anything, you did it with the ADSR. Even *I* can do it (and I'm not a
musician!) - have a listen to my version of the old SLL Sountracker mod
"Echoing" on the back end of my demo "Neoteric" and the lead does just
that.

Actually, if you do, notice the fourth channel on a 3 channel chip at
the same time... =-)

If you're writing with an assembler and have nothing that will be lost
during a reset (i.e., nothing at the start of BASIC RAM) you can switch
devices. So if I suddenly need data from my 1581 (which is normally
turned off, I don't like leaving it running for long periods) I can
throw a switch on the '41 to make it 9, turn on the '81 and thumb the
reset switch on my machine and kaboom, the devices all change around and
I carry on.

I will say that you're not *really* supposed to do that but... =-)

No, disagreed. The Amstrad CPC+ had more colours and I believe a higher resolution and, although it came a decade later, it was still 8bit. Personally, I don't consider it fair to compare two machines with nearly ten years age difference (I said so when it was compared to the c64) but if you're making a blanket comparison...

Oh, and there's the PC Engine as well. =-)

Try it the other way around, a PET/VIC/C64/Spectrum/Amstrad CPC user
goes up to an Atari and doesn't know how to launch the DOS...

"Difficult to use", in either scenario, is just a matter of perception
and expectation. If you don't know that TR-DOS uses LIST for the
directory and LOAD to load a file or that the Amstrad CPC uses the CAT
command for a directory you're not getting anywhere with it.

For HEAVENS sake get a grip!!
If he has some kind of brain in his head he would study the manual to the
diskdrive (or for the computer itself..) and then he would see 'load
"$",8' yeah.. and that's it.. Or maybe people who come from the atari are
too stupid to read manuals? :) don't take that last sentence too serious..

Yeah well, if we MUST have a religious war, at least the Atari had a decent device I/O subsystem.. plus it looked better- the Vic20 and C64 both looked like toys- and the keyboards sucked too. Yeah, I know the 400's keyboard was a mess, but any serious Atari person got an 800 REAL FAST- or rolled their own keyboard.

load "$",8'

what in the world is that???? Sheesh,

run "d:neato.bas"

or

dos

is MUCH more civilized.

;)

Actually, 8 seconds are enough to read (or write) a whole 140k disk
on an Apple II. That's very close to the physical limit, because
35 tracks at 300 rpm equals 7 seconds, and you need some time to
start the motor and step the head.

> I've always found C-64 keyboard/Joystick access to be very confusing.

I don't think the Apple way of reading the joystick/paddles can
be called "efficient" without smirking.

Was the Apple II the only home computer of its era to have a monitor
in ROM? I started on an Apple II and couldn't understand that other
computers didn't have that. It was nice being able to talk to my
computer in its native tongue, without an interpreter in the way.

> Hola again, Ronald,
>
>
Hola, Hola Steve! :)
ok, out of the box, i can write a program that sets up a display list (no dli-s) that chooses (nearly) every available gfx mode in the box on my atari, load up or draw some kind of text/gfx into that screen, then, in asm code, do a: $0600 JMP $0600 (infinite loop, this program is not doing a thing) and my screen will stay drawn as it is, complete w/ mode mixing, (and w/o dli, the c64 equiv being the raster interrupt, if i'm not mistaken) (i can also pop 4 sounds on the pokey, and they'll run until the computer is shut off, it won't be music, or varying sound fx, but i no longer need any cpu time to do anything else at all)*
*i assume the sid probably has similar capability
my point here is, you may be able to set up a similar screen on the c64, but, as soon as you do an infinite loop w/ no interrupts, your screen is no longer what you would normally intend to have (also, an assumption) and i left out character redefinition, since both can do that, (256 on the c64 w/ 16 colors, 128 on the atari w/ 128 of the 'inverted' video set <- don't underestimate the power of that statement although even i doubt there is anything in that that the c64 could do as well :)

Also, on the DOS and Autoload concept (the disk drive is always available at the time you turn it on for a c64, that's a good thing no ifs ands or buts about that...) but, you have to read a manual to use it... that's not very user friendly, there may be 25mil c64-family computers out there, but that IS your programming people AND market, and we all know it's a bigger market, but people have a history of simply buying what's cheapest and not the best technological devices. 2 examples: VHS, and CED vs. LaserVideo disks... <- since that statement's off topic and only used as an example, i won't go into that, but info should be readily available... on the atari - you turn on the floppy, load a disk, turn on the computer, and play... IMO that's a paradigm difference in user-friendliness.. (now, if you want an example of not-so-user-friendliness concerning DOS usage, it's my understanding.. and i'm doing this from memory, that you CAN use a disk drive after the computer has been turned on first, but it's not very easily done, i read an article in either ANALOG or ANTIC ...hmm.. maybe it was Compute! that demonstrated this capability, as i said, it's not easy, but it's there.... out of the box) :)

Actually i have 2 USD 1050s, and for a non-sector skewed DD disk, the
beeps are 2x as long, but at the same 'pitch', since the data is moved at
the same speed along the sio and the sectors hold 2x the data... however,
w/ a sector skewed disk! WATCH OUT! :)

I owned an Atari St for almost a full year (1988-1989) before migrating to the Amiga (was waiting for Amiga prices to come down in price...which did happen). During that time, GEM was attrocious. Yes, a version of GEM had been implemented on the IBM with better results but still didn't hold a candle to the Mac OS (Apple made sure of that via a lawsuit against DRI, the creators of GEM, which, believe it or not, originally planned for GEM to be for CP/M based machines.)

The Atari SC124 "paper white" monitor display was absolutely fabulous. I had purchased a used one in order to run my Spectre 128 emulator. Atari's RGB color monitor display was also great. In fact, it was so much better than Commodore's very own monitors that I purchased a special $30 Amiga-to-Atari Monitor video cable just to hook 'em together. This "mixed" marriage has, so far, lasted for 10 years and hasn't given me a day of trouble.

One more thing, 16 colors on a text screen, and an ADSR wave on the
voices aren't enough to convince me that the c64 is a more advanced
computer... they're nice, and have their place, and there are workarounds
for that on the atari, but not enough to make a difference to me...
(but, in all fairness, what i REALLY need to do, if possible, is to find
several pieces of IDENTICAL music, and hear them played on both, maybe w/
different types of players) (there are several different types of players
on the atari, i don't know how many there are on the c64)

With a hardware hack, the C128's 80 column chip could be upgraded to a
full 64K(?) for a full 640x200 color bitmapped display (possibly even
a mono 640x400 interlaced display).

After 1990 the Atari ST line of computers were a "non-factor" because
they were no longer available in my area (Rochester, NY). The only
information I ever got about Atari's newer computers were through
their Investor's Annual Report (NO. I DIDN'T LOSE MONEY).

Thanx. I've just pasted the URL into my "C64 stuff."

Yesterday, I was skimming the Creative Computing magazines and got better introduction dates for the VIC 20. Commodore's formal introduction (at CES?) occured either January or February of 1981 but wasn't widely available until around June of 1981.

Well, it also alot more flexible and powerfull, like read/writing blocks
from basic even... direct disk access, irq loaders, 25x fastloaders
(8k/sec!), whatever you want to do with the disk drive. It is easyer for
me in me, becuase the M$ basic 2.0 is VERY lame (Which I freely admit)
and that is the problem with the dos... not the disk drive itself.

The disk drives dos is very straight forward. such as M-E 00 02 , memory
execute $0200... preety simple :)

Just checked out your site. Not too bad (although I wished there was
more technical info).

I had never seen that original C-128 article. Wonder if I have it
buried in one of my American magazines? I also read your reference to
the IBM Charlie Chaplin advertising. It's kinda weird that IBM, and
not Commodore, used Charlie Chaplin in their advertising considering
the U.S. government thought Chaplin was a "Commie".

Good C-65 info. Considering the (60%?) compatibility, no wonder
Commodore canceled the computer. Too bad it didn't come out 3 years
earlier (around the same time as the Apple IIC plus).

Ok ok don't nitpick :-)

I was referring to voices in the sense of "apparent channels", in the
context of the thread.

We were talking about multiplexing the sound chip :-)

> Also, this should be viewed in contrast to Amiga multiplexing

Assuming a stock 1541 loads at around 2400 bps, this puts the top speed at
around 84000 bps, which is more than twice my original estimate of about
40000 bps.

See? Even I'm a little out of date :-)

> > > > >The standard loading speed on a C64 is anywhere from 2400 BPS to over
> > 25,000
> > > > > >(25 thousand) BPS.

I should have mentioned that these were averages with some of the lower
(i.e. cheaper, more readily available) cartridges when I wrote this.

Not to mention my wording was a little wierd anyways. I seem to have to be
correcting myself, or accepting others' corrections a lot more lately.

> > much faster. The standard drive runs at 19200 baud and my DTI chipped 1050
> > runs at at least 55000. I don't remember if this was the top speed, as it
> > was a small disk program that booted the speed even more.

Which puts the C64 at around 50% faster. If we're going to talk fast-
loaders, we should of course compare the very best that do not require
anything more than a plug-in cartridge.

I.e. no extra cables or ROM chips in the drive. That said, JiffyDOS
requires such ROM replacements, but I still prefer it to any other.

I don't know what the loader is mentioned in the quoted text above, nor what
it requires in terms of hardware.

>Oh, and there's the PC Engine as well. =-)

Just last month I began to read about the PC Engine (NEC TurboGraphics
16). Even though it was advertised as a 16 bit machine, the processor,
in fact, was 8-bit (but the graphics chip was 16 bit). Still, I was
resonably awestruck by its capabilities (up to 512 colors on-screen,
hardware supported fine scrolling, EXCELLENT sprite support that puts
the AMIGA to shame).

The original 8-bit Sega master system also appeared to have some very
good graphics ability but, for some reason, the games weren't very
good.

Then there's the Atari (actually EPYX) LYNX handheld which, for the
time, was also quite astounding.

Really, considering the long staying power of the 8-bit processor in
computers/consoles, the 8-bit era should be broken down into
subsections. Here's a quick (not very thought out) proposal.

EARLY: 8-bit computers/consoles introduced when the price of 64K of
RAM and significant amount of ROM made it impractical for initial
incorporation into the device.
(Apple II series, Atari VCS/2600, Atari 800/5200 series, Commodore VIC
20, Odyssey II, Texas Instruments TI99/4, Radio Shack COCO,
Colecovision)

MIDDLE: period when the price of significant RAM/ROM was cheap enough
for initial incorporation into the device.
(C-64/128, Nintendo)

LATE/TRANSITIONAL: 8-bit computers/consoles that also contain 16 bit
support processors (NEC's PC ENGINE, Atari LYNX,)

Well, C= shoul:d have gone Centronics cables, and kept the 8 bit
parallell ieee buss, it would have smoked everything for a decade. But
since we just have serial, it is still working well, and is multiplexable.

load"neato.bas",8
run

ok, not much differen there...

why not just like a pc then

neato.bas, runs the program... heheh

different versions of the same thing. At least we weren't submitted to only having 100k or so... that's 3-4 programs disk side... atari dos really wasted the disk space...

The C128 , C128D has a built in ml monitor. Quite nice too. I prefer an
Action Replay or other super cartridge for it tho... and haveing a nice
assembler like Turbo Assembler...

I really disagree with this comment. One of the best reasons (for me)
to revisit the 8-bit line of computers/consoles is to gather a greater
understanding on how the hardware performed it's magic and also the
philosophy why the manufacturers incorporated (or didn't...shame on
them) certain functionality. The period of time when the 8-bits ruled
was when all the hardware was pretty much set in stone and programmers
had the time to truly understand and take advantage of the limitations
and stretch the limits of these machines. This is a far cry from the
current time when today's video card or CPU or BUS STANDARD will soon
become yesterday's doorstops within just a single year and the
software companies of today care more about the consumer that
purchases a new PC in exactly 6 months than coming out with products
that try to take advantage of recent technology .

Admittedly, I do have a problem with certain people that chose to make
insults (sometimes directed at me) but am willing to overlook it when
its backed up by a modicum of information that I previously didn't
know.

Sorry for the poorly structured rambling...but, after reading the
previous comment, I just had to get it off my chest.

I find the majority of what's been posted to be anything but "brand
bashing" and feel that many of those you interpret as doing this is
really, in fact, expressing their deep-seated love for past memories.

Oops. I didn't know there were C-64 clones. I assumed that (unlike the
Apple II line) the C-64 was so cheap that clone manufacturers would
have never been able to eek out a significant enough profit to justify
it's manufacture.

Nearly-identical architecture machine? This implies the inclusion of
game machines. If so, then I believe the Atari 2600/VCS and Nintendo
worldwide unit sales were even greater.

A large portion of the C-64 OS (KERNAL) was a carry-over of previous Commodore computers (PET, VIC 20) with a few extensions/modifications needed to interface with the newer hardware. The flexibility of the KERNAL OS facilitated in Commodore being able to rush a new computer to market with minimal fuss and allowed programmers to more easily CONVERT (still requiring some rewrite) previously written programs to the newer machine.

I had no major problem with the C-64 OS (certainly in comparison to the hack Apple II OS) but it still had a somewhat quilt-like "evolutionary" feel whereas the Atari OS was somewhat more "revolutionary."

All 8-bit computer OS's (Apple, Commodore, Atari, Adam, etc.) allowed for the above character output-style code to the screen. I assume CHROUT is a vector that can be redirected for writing that character to some other device?? (disk drive or the C-128's 80 column screen) What's the C-64 output vector to write an entire string of characters?

I'll have to look for the Atari programming manuals to give you a more accurate coding method. (don't hold your breath)

>My personal feeling is that the Atari OS is a decent idea which
>is for the most part fairly impractical and unnecessary for an
>8-bit computer. That is, as a theoretical proposition it is fairly
>attractive, but as a practical implementation it is fairly cumbersome.

To a certain extent, I agree with your assessment of the Atari OS. "Properly written code" on the Atari did waste a lot of processor cycles. However, the Atari OS was a harbinger of how the 16 bit (and later) OS's would ultimately behave.

Oh, here's another reason that the Ataris apparent speed wasn't as fast as the CPU clock speed would lead one to believe. Every 60th of a second (during the VBLANK) the Atari OS would cause an interrupt in order to handle various upkeeping (such as rewriting color registers, transferring "soft" registers to hardware registers, etc). If necessary, GAMES or other apps could turn this off, replace, or add their own VBLANK code. (I don't believe the C-64 OS ever bothered with this technique.)

Here's more fodder for your derogatory remarks concerning the Atari:

The Atari hardware register responsible for Keyboard input did not correspond with the ASCII (actually ATASCII) equivalent. And neither of these keycode representations corresponded with what would ultimately be sent to the display. Due to this disparity, the Atari OS had to contain 3(?) separate tables for the necessary translation between keycode, ASCII, & screen display.

> is called an Apple PROFile drive and was compatible with the Apple III and
> the Apple LISA (MAC XL)

... and also with the Apple II, if you added an interface card. I seem to recall that you needed an Apple III to format it, though. It was never popular with the Apple II crowd because of its dismal performance and high price. For Apple IIs, the hard drive of choice was Practical Peripheral's Sider. Their ads said "Only $699 for a 10-megabyte hard drive?", which was a great price when the ProFile went for upwards of $2000.

Other companies also made HDs for the Apple II (actually, they made interface cards that allowed their S-100 drived to talk to the Apple II). Each company had its own patch set that allowed DOS 3.3 and other operating systems to talk to their HD. Some also sold pre-boot disks for popular business programs like Visicalc, DB Master, etc.

That's always a problem with ports (which is why I've never bought another LucasFilm game, since purchasing, AT FULL PRICE, the miserable BATTLEHAWKS:1941 for the AMIGA). I would assume RESCUE's "speed-up" could occur at the original 1 megahertz C-64 clock speed? Bear in mind that the original RESCUE ON FRACTALUS (for the Atari) was intended to fit in under 16K of ROM code and access no more than 8K of RAM (in order to run on the Atari 5200 and lower end Atari 400 computers). I would assume that, by taking advantage of the C-64's standard full 64K of RAM, the game could be speeded up. However, the same techniques would probably allow the game to run faster on the RAM beefy-er Atari computers, as well.

>>>SID is really rather sophisticated -- each voice can have four waveforms,

A noise waveform is nothing for the Atari. It would require just (2?) simple POKEs or, better yet, a standard BASIC sound command.

SOUND (VOICE# of 0 to 3), (TONE? of 0 to 15), X, (FREQUENCY of 0 to
255)
ie.
SOUND 1,11,0,100

Some TONE numbers (from 0 to 15) give a "pure" tone (14?) and others
give other effects, such as "noise" or a tank rumbling sound used in
COMBAT.

(NOTE: the above is information is entirely from vague memory and is
not intended to be entirely accurate)

>>inability to change the volume of individual voices). However, this in

>volume envelope.

Which is why I had previously indicated that, for understanding sound
programming, the SID chip is better than the Atari's POKEY chip.
However, both of these chips are by far better than what the IBM and
Apple IIs supported.

Remember, when the Atari 8-bit was new, most people only had
experience with cartridge (or was it CD? JOKE) based game machines
where one would pop in a cartridge, turn on the power, and,
subsequently, only be bothered with the Carpal-tunnel inducing
joysticks. The original Atari 8-bits (before the advent of the OPTION
key befuddling XL machines) allowed people to easily migrate to a
"real" computer in just seconds without throwing up their hands in
disgust. The C-64s just DID NOT HAVE THIS ADVANTAGE!!!!! PERIOD!!!!!

READ MY OTHER NEW POST!

UNLIKE COMMODORE, ATARI ATTEMPTED TO COME OUT WITH A COMPUTER THAT
COULD BE AS SIMPLE AS TURNING ON A LIGHT! THIS DOES NOT AT ALL MEAN
THAT THE ATARI'S WERE MORE POWERFUL...JUST A LITTLE BIT EASIER FOR A
NEWBIE (ie. a 7 year old kid who can't read manuals) THAN THE C-64!!!!

I can't understand the need to argue on a point that, I thought, was
simple to understand. Maybe this (stupid?) analogy would help:

When purchasing paper to feed into one's laser printer, would a person
usually get paper cut to the necessary size (9.5 x 11) or get poster
size sheets that they then cut to the proper size? END-USER SIMPLICITY
IS THE KEY!

In terms of look alone, I've always felt the Atari XL's were the best.
Why is it that the computer industry is rarely able to come out with
computers that look "sexy"? Thank god computer companies (including
Commodore) never manufactured cars. They would all be colored gray or
manilla and look damn ugly!!!!

Even factoring out the Atari 400, the quality of Atari keyboards were
highly variable (1200 being the best). Also, the placement of certain
keys were STUPID. Most Atari users (including me) would "accidentally"
hit the BREAK key when initially aiming for the BACKSPACE key. On
average, the Apple keyboards were by far the best.

It can be much simpler than this on the Atari. For prepackaged,
commercial software, one can simply insert the disk, turn on the

computer, AND THAT'S IT!!! No "LOAD "$",8"! NO "RUN "D:NEATO.BAS"! NO "DOS"! Heck, even "lowly" Apple II computers could achieve this miracle of modern civilization. BUT NOT THE C64!!!!!

For some reason, considering the number of "negative" responses sent
to me, I'm failing to get my point across. Simplicity is the key to
good design. Unfortunately, the majority of computer hardware and
software companies fail to understand this. Apparently its gotten so
bad that this disease has rubbed off on many "sophisticated" computer
users (and the people writing responses to me).

There should be a strive towards making computers as simple as
possible (without sacrificing power). The ultimate symbol of
simplicity is turning on a light switch. Console game machines achieve
this. Most general purpose computers fail. (although Apple has made
noble attempts with their Mac and IMAC line) Something as simple as
loading a program (or game) should be achieved by turning on a power
switch. The original Atari 8-bit computers could achieve this goal.
Commodore 64 computers fail. SIMPLE!

I still stand by my previous statement. The C-64 and Atari may achieve
a form of 3D (with wunderkind programmers) but at nowhere near the
level of many "state-of-the-art" PC games. 20-30fps wire-frame games?
That's a thing of the past.

I like your statement in regards to enjoyable games. As is usual
during the history of computers, or movies, or TV or books, or
..whatever, most of the stuff that comes out is essentially
"shovel-ware". Just because the widget is "new" or contains
state-of-the-art special effects or color , as opposed to
black-and-white, doesn't mean it's "better" than its ancestors. I'd
rather watch a good black&white episode of the "OUTER LIMITS" than a
color, computer enhanced, episode of drivel like "SEAQUEST." And I'd
rather play a good, albeit primitive, game like JUMPMAN on the C-64
than some superenhanced, 3D card specific game like Wipout XL that has
sucky joystick control.

I've checked some of the URLS concerning the C-64 (and found some of my own). I've also downloaded a C-64 emulator which, unfortunately, runs very slow on my main PC computer (486/120). Eventually I'm going to find a way to port the demos to my C128 computer. Unfortunately, this is one of many, many things I "wish" to do on the NET (the most important, of which, is to collect software from those 16 bit non PC computer systems).

One of the URLs (don't know who sent it to me) contained some interesting graphics of some of the new display modes. The information contained on some downloaded "hackers" pages contains low-level info on how it's achieved, but is very hard to totally understand without repeated readings. However, some of the increased number of colors appear to be achieved via "page flipping" and color clock manipulation which, on possibly a more rudimentary level, could be achieved on the Atari. It appears that the 1/2K color nybbles (something I wish the Atari had) also is being manipulated.

Have you ever seen the Atari's 16 grey level GTIA modes in action? They're very low res (80x192) but have been handled amazingly well with a few demos (walking robot, starship launch from mothership, and large moving starship against an animated starfield)

The Apple monitor was nice to have around. Unfortunately, I believe, Apple was a bit wishy-washy on implementing it on some Apple II variants.

The Ataris were pretty much DOA when Psygnosis began producing
software. I'm about 99.99% sure they didn't produce a single Atari
8-bit game...not even LEMMINGS.

Hold onto your mouse. I was browsing through 1981 Creative Computing
Magazines and came across a mail-order company selling Apple///
computers (with mono monitor, disk drive, business software) for the
astoundingly "low" price of $5,200!!!!! For about $400 more, you'd get
yourself a printer with the system. There was no hard drive in site.

>Curt

On the whole, I'd agree with your assessment of MFM/RLL hard drives versus IDE hard drives. However, the older standards had one thing going for them: easy low level formatting (for those in the know). I used to be able to get the older style drives dirt cheap because of some formatting defect which I was (usually) able to fix by performing a low level format. Nowadays, when an IDE drive acts up, one requires a special utility direct from the manufacturer of that specific drive which, hopefully, will have the necessary functionality to perform a low level format. Usually, though, the utility only has the option of circumventing the bad areas which, if there are too many, will not work.

Alot of the limitations of the various PC hard drive standards are also due to the limitations of the PC's BIOS/DOS/WINDOWS. For example, because of the BIOS upper limit of various track/cylinder/sector numbers, most IDE drives perform internal sector translation which fools the PC into believing the HD is configured an entirely different way. Trying to low level format such a drive (without the proper utility which may or may not exist) can trash the HD.

And I don't even want to get into master/slave/primary/secondary/primary dos partition/secondary dos partition sh*t as well as the musical drive letters that the PC forces on users. (now let's see, which drive letters correspond with the secondary master HD?)

> left.

Finish the second level, and you finish the game. Having said that,
it isn't easy to finish, you do need to be good and have a lot of
patience. The second level is about as big as the first, but the
layout is more complicated (it's not just going up and down platforms
like in the 1st level). The goal of the second level however is
similar to the first.

As for the tips:
1) Draw a map! (or use the one at http://www.clark.net/pub/vgr/pitfall2.html)
2) Practise the timing of your jumps to avoid the nasties and jump
across the platforms. You need to learn how to dodge all the
different types of nasties in the game.
3) Try placing a heavy weight on the spacebar if things get too fast
or hard.

>that I didn't blow something up. :-)

If I remember correctly, the spec on an Atari 800 power supply went
like this:

9 Volts AC @ 31 VoltAmps

31V divided by 9 V equals (roughly) 3 Amps

The power supplies you'd find in the Wal-mart electronics department
would be rated in the range from 300 to 500 MilliAmps (.3 to .5 Amps)
which is way too low for the needs of the Atari 800. You may want to
check Wal-mart's automotive, lawn, or hardware departments for
possible substitutes (maybe).

> Also, really quick, I'm assuming that any old RF switch will work if I

Most any RF switch should work...including Nintendo's. Even if it
doesn't, nothing will get ruined.

LDY #0
You should also load the secondary address into YR
> > JSR SETLFS
Set logical file parameters
LDA #<FILENAME
LDY #>FILENAME
LDX #FILENAMELEN
JSR SETFN
You should actually
set a filename as well with SETFN (two registers
are the address, one the length)

> > JSR OPEN ;Open a channel to the printer

This takes the device number and opens the file
given as filename on the device.
On disk that would be the filename, printers
could use the filename to enter a specific mode.
The secondary address could be a specific channel
on the device (e.g. ASCII/PETSCII switch on printers,
disk control channel instead of data channel)
RS232 interface uses the first two filename characters
as control parameters (baudrate,...)
BCS ERROR
and you might get an error...
> > LDX #4
This is the filenumber, not device or whatever.
You might have several files open on one device
(e.g. two open files on disk)
> > JSR CHKOUT ;Make it the output channel

lda #"H"
jsr BSOUT
Now anything you print to BSOUT is sent to
LDA #"E"
```

jsr BSOUT
the opened file, until you do a
JSR CLRCH that resets input to keyboard and output to screen,
without closing the files.
lda #"L"
jsr BSOUT will go to the screen
Another
LDX #4
JSR CHKOUT
would send the next bytes to the file again
lda #"L"
jsr BSOUT
To close the file you do a
JSR CLRCH
and then, well, close the file
LDA #4 the filenumber
JSR CLOSE
and
lda #"O"
jsr BSOUT will go to the screen again :-)

> Could you comment each of the above lines for me? What would happen if
> another number other than #4 is substituted? Does the OS support
> entire strings of bytes or is the above brute force method required to
> simulate it?

Devicenumbers available in the C64 are:

0 = keyboard (input only)
1 = Tape (load (secondary=0)/save(secondary=1)/data read/write)
2 = RS232 (secondary ignored) (used to be second tape device in PETs)
3 = screen (input & output, albeit this is a bit complicated - means I
don't remember at the moment - and has to do with the fullscreen editor)
4-15 IEC-bus devices, like (usually):

4,5 printer devices
8-11 disk devices

and others are available.

Input works the same way. Instead of CKOUT you call CHKIN and instead
of BSOUT you call BASIN and get the received byte in AC.

About expandability: All of the above routines have RAM vectors
as far as I remember. However, there is no general mechanism to
add devices, you have to intercept and check all of them.

Andre

I never had a problem word processing in 40 colums versus 80 columns.
Of course, we can't have that now because EVERYTHING'S WYSIWYG (Why,
Yes, Stupid, I Want Your Gui)

The resolution requirements of today (800x600 or HIGHER) can cause
serious eyestrain. If I had my choice, I'd bump my monitor down to
640x480 but many apps and web pages are set for the higher resolution.
Heck, an Amiga screen resolution of 640x200 was quite adequate for an
icon infested graphics display.

Except that the Atari's are only accessing disk drives when a program needs to be loaded up whereas the PC is constantly (and I mean CONSTANTLY) swapping code segments in and out of the drive (which, in itself, is damn annoying).

>
>TI99/4 is/was 16 bit (the CPU, at least)

...and no internal registers (other than a few pointers to memory)
which kinda slowed down the TI (still, it made it ideal for potential
multitasking :-).

The TI/994A was an odd duck in this respect but, because of the period
of time it came out (ie. need to be RAM conscious...and a RAM/ROM
barrier that wasn't significantly beyond the base 64K of an 8-bit
system, and the "general" performance of the system being about the
same as other early 8-bits) I still believe the TI 99/4A was still
firmly rootedas being on of the EARLY style computers.

My concern is how to label certain computer lines that were constantly
upgraded to the point where individual models could cross to a level
higher than their 8-bit ancestors (ie. the Apple IIGS).

Yes, and it is outstanding for this little machine. It's one of the best
games released for 2600. A must have for 2600 collectors and players.

There's a PC-4 in this desk here, and I love it. 1.5K of memory, and you
can get a lot of mileage out of it. Its limitations disappear quickly
once you familiarise yourself with it.

> hold SHIFT down do temporarily disable autoplay when you incert a CD?

Yes, of course, but I was ranting by that point. And it's not so easy
to hold down shift if the CD drive is as far away from the keyboard as
mine is... =-)

> Also, you can disable autoplay altogether permanently too if you like.
> Autostarts ARE a feature.

You *can* disable it. But there are a few programs that, during
installation, turn the sodding thing back *on* again. Like the way IE3
will re-enable MIDI sound if you have it muted...

> Likewise on the Atari you are not required to boot anything.

So, it's not a permanent feature, it's something you need to know. Like
the LOAD"*",8,1 command on the C64...

> You must boot DOS in order to use disks. It doesn't actually run a
> application though unless it is called AUTORUN.SYS or STARTUP.BAT in

> use disks, it's just that it loads it in from ROM inside the drive?

No, the DOS on the C64 is in the ROM of the machine itself, no transfer.
The *other* end of the DOS in the drive has it's *own* CPU and RAM.

> SpartaDOS X loads very quickly also since it is ROM based.

And it came as standard, did it?

Right, 0-7 channels, but you normally have things like the cassette,
screen handler, etcetera loaded on boot so from a practical standpoint
you don't have all 7 free.
>
> Handler Address Table consists of 128 bytes (on page 3?) whichis

> (within any of the 8 regions) would allow a program to pass different
> pieces of information to the OS(such as beginning address of bytes to
> move, length of byte string, line draw and AREA FILL, etc).
Been a while for myself too, but I think the handler table was/is a
structure consisting of 3 bytes. The bytes were just the device chr ID
+128 so it could be searched rapidly. That is, if you decided to add an
A: handler located on page $6, the structure would be inverse A on an
Atari or 65+128, followed by the $00 $06. Each entry was 3 bytes anyway.

On page $6 you would have a table that contains vectors to each of your
routines for each of the functions you implement. IIRC, they table was
set up such that it actually had vector-1. So if you had your PUT
function coded at $1000, you would actually put $0FFF in the table.

Page 3 was mostly the CIOV channel usage/blocks. That is, another table
of values/flags that could be user set to pass information to the CIOV
routine. For instance, if you had a channel open for block transfer of
info from the disk drive, you would just put how many ~bytes to
transfers & the destination in the 16 byte control block & JSR CIOV.

Seems overly complicated, but in use it was pretty easy once you got it.
The difference between putting & getting $4000 bytes from disk was about
as simple as changing the command in the IO channel from a 4 to an 8 to
change the direction of transfer.

Bill Wilkinson gave the Atari OS as one of the reasons they were able to
fit so much functionality into the 8k Atari Basic Cartridge. For opening
the disk from Basic, it was a relatively simple process. That is
translate:

OPEN #3, 4, 0, "D:MYFILE.DAT"

Into a couple of bytes stored in channel 3's control block & JSR CIOV.
>

> How right/wrong are my recollections?
At least as right as mine<grin>! I should get out my copy of Mapping the Atari, but I hope people realized this is all from memory & I haven't programmed on the Atari in about 5 years.

Always some anal retentive type that jumps off the wall & says, "You idiot, you called it a control block! It is an I/O control block!" or some other such trivial complaint. Nature of the usenet beast I think.

Seems like the CIO thing was probably around just about since day one of computers & certainly every computer since the late 70s has used some variation of it. Even IBM clones use the same concept.

1166. Decoding Composite to RGB

Hi,

Just throwing a question out to anyone who has toyed around with this. I'm building a Motorola TDA3330 decoder interface for the Atari 8-bits to allow them to use monitors such as the Atari SC1435. I'm not tapping the 4050 like many other modifications but actually taking the composite right out of the monitor port (after performing the Super Video 2.1 upgrade to clean up the bleeding and ghosting), has anyone worked with building a burst-gating circuit? Has anyone out there worked with the TDA3330 before and run into and issues. I'm hoping to do an external interface so that this could be used on all the 8-bits and utilize the ST series monitors. Let here back from anyone who's got a good analog background and could be of assistance. Thanks.

Curt

And that was one of the major problems with atari software. Most were ported over from some other machine. Take a look at mind shadow from Activision. Looks just like the IBM version. colors are a little better and I mean a little.
A lot of the games that were ported over did'nt take advantage of the atari. sad but true.

I think the only game that used this controller was the 2600 version of
Star Raiders. It works the same as the keypad controller for the 2600 Basic
Programming cart, except that the overlays don't fit. The early Atari 400/800
Basic manuals had examples of programs to use this type of controller.

(I can't believe I'm entering this discussion)

Excuse me, but real world numbers are only to a certain finite precision.
Let's say a post office letter scale has the resolution of 00.000 pounds.
That would mean that you could have a 2.000 pound package. This
_measured_value_ is an integer. The actual theoretical weight only has a
1/infinite probability of being an integer, but your "measured value" is an
integer.

> (and headaches) of collecting.

Most of the CDs around cover only the "popular" titles. One CD I have
that was compiled in 1993 from *one* persons collection contains about
4,400 games, over 1,000 tools and nearly 8,000 demos. And the C64
releases didn't stop in 1993.

In fact, I'm releasing a new game in the next couple of months... =-)

Bah. Shows how much you know. IEEE-488 wasn't really ever used on the
Commodore VIC-20 OR C-64 (although the routines exist in kernal on the
64 at least)....besides IEEE-488 is PARALLEL and therefore will kick the
crap out of SIO. Come to think of it, I think that the official
Commodore hard disk for the 64 was an IEEE device. Anyways, if it sucks
so bad, how come it was used well into the mid-to-late-80's??? IEC was
the serial port used on the VIC-20 and C-64. Besides, fast loader
routines (<sigh>, how many times do we have to say it) would speed disk
operations by 40+ times the built-in routines?

> the past, so Atari's strengths: its custom chips are also its downfall. The

> the USB design working at Microsoft today.

Please. SIO is just a freakin' serial bus. There's nothing special about
it. The ADAM has one of those too, it's called "ADAMNet." It's a 64kbps
asynchronous serial communications port, complete with DCB's (device
control blocks) for addressing multiple devices. I'll bet that it will
kick the crap out of SIO (and definitely Commodore IEC), since it's DMA.
This means that you can use a game WHILE part of the game is being
loaded into memory on the ADAM. ADAMNet supports up to 16 devices. I'll
bet USB has more in common with ADAMNet than Atari SIO.

Point being, serial communications is serial communications, and bits is
bits.

Geoff!

I wouldn't classify the TI's system performance on par with other 8-bit machines, unless of course programs were run through TI Extended Basic or the Editor/Assembler on an expanded machine.

Reason being is that the BASE system only had 16K of memory (plus 1 or 2k extra I think for registers or whatnot). The PROBLEM comes in when you realise that the system has 16K of system memory TOTAL. This is a problem, because the TMS9918/28 VDP *REQUIRES* 16K of RAM to do anything. This means that programs that run on a base system in TI BASIC are *EXTREMELY* slow, since to do anything in memory, the system has to talk to the memory via the video display processor. That's right, a base TI uses the VRAM as System memory. Yuck!!

I remember loading programs on my TI "back in the day" off of floppy disk in TI BASIC that were, oh, no more than about 10K I think, and WAITING 5 MINUTES for a prompt to come back up on the screen to actually RUN the program. I think the reason for the delay is that it would debug a program before allowing you to run it.

Still, the TI has some nice features, and it's a lot of fun to play with. :)

Geoff!

Richard Cortese:
> More relevant & something I would like to know. Just exactly what are
> the minimum and maximum amounts of ram for the display?

Stock:
Minimum: 1,000 bytes
Maximum: 9,000 bytes

With trickery:
Maximum: 32,200 bytes (for an IFLI, but it would be possible to exceed)

I've excluded the 1,000 bytes of colour RAM in all three cases since
it's actually a shadow and the RAM underneath can simultaneously be
assigned another job.

Where did he say they compared visually?! Look, I'll explain another way. I like cheap science fiction television (no names, not after what happened last time! =-) and would rather watch these shows, with their crap special effects and stilted dialogue than *any* of the slick, CGI based sci-fi television presently available. Why? One has content, the other just *looks* nice.

But if you feel compelled to watch a film because it has a multi-million dollar effects budget or play a game because it has the latest texture mapped 3D engine *just* because it's got a large effects budget or *just* because it's got the latest texture mapping then all the best to you and I won't stand in the way of your pursuit of happiness.

But I'll stick to my cheap sci-fi and my wireframe games, ta.

What's *not* cryptic about a TLA? The argument runs that you need to
read the C64 manual to learn LOAD"*",8,1 and, granted, it's a more
complex command than just DOS. But you still have to *know* to *type*
it, don't you?

> ATARI!!! (sniff)

A 1541 - the most common drive used with a C64 - has 2K of RAM,
and 16K of ROM, and a 1Mhz 6502. Later drives (such as some of
CMD's line of nifty drives) have as much as 32K (maybe 64K).

Commonly this RAM is used for buffer space, but of course there's
nothing preventing one from putting programs in there and running
them. Some 1541 users installed extra RAM in their drives so
they could run more complicated programs that allowed commercial
software to be copied that couldn't be done in only 2K of RAM.

As Steve pointed out elsewhere, I think it's great that I can buy
a new drive (like my spiffy CMD FD-2000 that uses standard HD
3.5" disks - 1.6MB each), daisy chain it on to my existing drives,
and it works - no ROM upgrades, no extra software, patches, etc.
It just works like any of my other drives.

>anytime during the display you can have the horizontal player 'band'
>move to any postion on or off screen.

I think you'll agree that duplicating multiple (let alone eight)
21x24 sprites with a CPU -- moving the "software sprites", detecting
collisions, etc. -- will entail a very substantial performance hit,
even ignoring things such as background collisions. I would not term
this a "simple workaround".

>> 16 colors on the same raster line, for playing different waveforms,
>Kind of a straw man arguement isn't it? I mean an Atari could have
>something like 24 different colors on screen at once by just chosing a
>graphics mode with text window with P/M graphics enabled. Not even a
>single line of machine code needed. Butt ugly & not really used.

But what is important here is that they are all on the same horizontal
line, without any exceptional programming effort. I mentioned the
ability to have different colored text. But consider a game like
Ultima, which has different character-blocks which represent grass,
towns, monsters, ocean, and so on -- each can use different colors,
without any restrictions. Then consider a game like The Bard's Tale,
or Hacker, in which the screen is made up of different "windows", like:

```
AAAAAAA BBBBBBBB CCCCCCC
AAAAAAA BBBBBBBB CCCCCCC
AAAAAAA BBBBBBBB CCCCCCC
```

Thus window "A" might display some sort of picture -- of a monster,
or some other type of graphic -- while window B contains information,
and window C contains a status display. Each window can have it's
own palette, because colors may be fetched from RAM, instead of a single
color register. In other words, the result is, in general, a 16-color
display, not a 2- or 4-color display, which is why I make the comment
that although the Atari has more colors, the 64 is in general more
colorful. I do not feel that this is a trivial feature or a frivilous

argument (it is certainly not a strawman argument, as I have no
intention of disproving it!).

>More relevant & something I would like to know. Just exactly what are
>the minimum and maximum amounts of ram for the display?

Well, you can just count the bits -- 320x200 pixels is 64,000 pixels,
which gives 8k (8 pixels per byte). A text screen is 40x24, or 1000
bytes. Color is always 1k. As Jason said, though, you can always
use more if you really want to :).

Custom characters take 8 bytes for each character.

>> or for timer-based interrupts? What effect would a given workaround
>
>Atari has timer based interrupts coming out the kazoo. Both the Pokey,
>Pot keyboard sound timer serial chip, and the Antic, alpha nummeric
>telivsion interface<? god it has been a while!> chips have interrupts

Perhaps I should be more specific: I want to control the timer. Could
you provide a piece of code which generates an interrupt every
12345 cycles? (I am indeed curious about this).

>> have on the system or program performance?
>
>You have to pay the band if you want to dance.

I agree -- it takes a pretty serious performance hit to duplicate some
of the more fundamental C64 features.

>BTW: Thanks for the other post on C64 device independance, it was
>exactly what I was looking for. I responded to Robin since I got his
>message in my newsreader first, but your post was very imformative.

You are quite welcome; thank you for the question, and the opportunity
to clarify the issue.

Heh... the way some people talk, though, you get the impression that
they can hardly wait to get home for an all-night session of renaming
files and formatting disks.

You must admit, it's kind-of funny to think about -- I imagine a kid
running home after high school... "No time for Jumpman! I just got
a whole new batch of blank floppies!!!" ;-)

Are you sure of that?

My references are all in boxes, but my recollection is that the
throughput of an Atari disk drive is 1000 bytes/sec. Not much to
write home about, although twice as fast as the stock C= loading
speed of 500 bytes/sec. With a fastloader, the 1541 is quite
a lot faster than 1000 bytes/sec.

Did I remember correctly?

Yup! The DOS wedge (not to mention cartridges and JiffyDOS and such)
directories are nondestructive, though.

The alternative is to write a little piece of code that is remarkably
similar to the one you wrote above.

Actually, there's one other alternative which occasionally works:
LOAD"$",8,1 -- that will load the directory to $0400, which is
the screen, instead of $0800, which is where BASIC programs begin.
'Taint very pretty though :).

The Atari, through the CIOV (Central Input Output Vector) supports onscreen editing when sending info to the E: device.

My mistake. You're right about the keyboard interrupt generation. It
would occasionally interfere with DLI's (a more sophisticated form of
C-64 raster interrupts). and would cause annoying color flashing if a
DLI was used for color palette modification,

>in essence, 16-color screens.

Of all the so-called C-64 advances (over the older Ataris) the C-64's color nybbles were the one thing I most wished was incorporated into the Atari 8-bit architecture (with, of course, the added benefit of allowing for a full 128/256 color range rather than the C-64's paltry 16). Real C-64 style sprites (and its greater possible resolution) would have also been a (somewhat more minor) benefit.

>>computer...
>
>Hmmmmm... perhaps I am simply dense, but which part of sprites,
>color RAM, SID, twice as many characters, and so on is the part
>that makes the C64 less advanced?

It's been my experience that no machine (of equivalent vintage) is more "sophisticated" in every way than another. Even though one could do some wonderful things on the Atari's POKEY sound chip, the SID chip was far and away the most sophisticated of the two. The POKEY chip could "simulate" certain aspects of the SID in the same way that an Apple II could "simulate" Atari or Commodore hardware based sprites. However, This does not at all mean that the Apple II sprite ability was just as sophisticated.

The IBM CGA display can support this in hardware but, I assume, you
mean that it can be very simply accomplished via a few simple
keystrokes. I also liked this C-64 ability (remember spending over
half an hour just playing around with it).

The Atari can display various color text via DLI's and double width
Player/Missiles (set to hide behind the background color), but is not
anywhere near as simple (or as sophisticated) as the C-64 method.
(See? At least I can make these distinctions. This small comment is
directed at others, not you.)

>would simply not be _possible_ without sprites.

Not Possible without sprites? I've seen some amazing stuff on Apple
II's without any hardware based sprite facility. However, all else
being equal, I much, much prefer having access to as many hardware
based sprites as possible. You're right about the one flaw of the
Amiga, which essentially has a slightly more sophisticated version of
the Atari 8-bit method. Even back in the 80's, I wished the Amiga's
sprites were as sophisticated (and numerous) as what I've recently
learned about the NEC TURBO GRAPHX 16.

>game machines (Nintendo, Genesis) have a similar (and superior)
>capability, and with good reason -- sprites of this power are
>_extremely_ useful!

The original Nintendo's sprite facilities weren't any more
sophisticated than the C-64. The SuperNintendo, on the other hand, was
a whole 'nother ball 'o wax.

Yeah! I'm sure everyone would want the CIA in their home (JOKE).
Seriously, though, the Atari's (POKEY?) has three 16 bit hardware
timers (supported by the OS...a fourth if the OS was bypassed) which
can also count down in machine cycles (if necessary). This can be
achieved without affecting the sound functions (forgot if the C-64 had
this quirk). And this is on top of VBI's (both immediate and
deferred), DLI's and (possibly?) the more primitive (but still
powerful) form of RASTER INTERRUPT. Oh, and there's also the keybaord
interrupt (which, without clever programming, can screw up some of the
previous forms of Interrupts).

>Well, that's it. http://stratus.esam.nwu.edu/~judd/fridge/atari.compare

I'm going to check that URL. Thanx.

Atari 128/256 color capability is not at all frivolous. If it is, then
so is the C-64 color text, SID chip and, oh heck, even sprites and
lower case text. We all might as well have chucked out our Ataris and
C-64s in favor of the Apple II+, which contained very little
frivolity. :-)

>powerful Atari feature is the ability to start graphics data at

Certainly not! And neither will the C-64 display 16 separate
luminances of any single color. Of all my original computer/game
machine experiences, that singular Atari ability floored me the most.
(not unlike seeing the first Star Wars movie for the very first time).
Of course, that ability came at a price: only an 80 pixel (2 color
clock each) horizontal resolution.

>Which isn't a very good conclusion.

Good point. But, you have to admit (please?), manipulating only 4K of data would produce a faster framerate than manipulating 8K (double the amount) with the same speed processor. Unlike the Atari, the C-64 didn't have hardware based low res display ability. (I can't believe I'd see the day where I'm making the argument for lower resolution. I must be getting senile). Due to this, a properly coded Atari version of Rescue on Fractalus would still be faster than a properly coded version for the C-64.

Many multicolor platform style Amiga displays ran better than the PC variant partly because the amount of RAM allocation for screen memory was more customizable. If 32 full screen colors were enough for the game, the Amiga could open a display containing RAM for exactly 32 colors. The IBM's VGA display forced one to open up a 256 color display regardless of the amount of colors the game truly needed.

I still haven't yet dug up the proper info. When I do, I'll try to give you a hardware overview of POKEY sound programming. Again, it's not as sophisticated as the C-64, but should still be easier for a newbie ML programmer to cope with it (POKEY) than the SID (WARNING! AARON'S FOOT IS PREPARING TO ENTER MOUTH!)

Excellent point (sniff). The C-64 disk drives have, I believe, 256
bytes of RAM which could be loaded with program code to produce true
multiprocessing (as opposed to the lamer version of multitasking) for
things other than drive-only maintenance. I've heard of one user
actually getting the drive to calculate Floating point code while the
C-64 dealt with other, less mundane, tasks. TRY DOING THAT WITH AN
ATARI!!! (sniff)

Quick ease of use is always an advantage In the same way as roads and
highways are preferable over driving through forests, lakes, and
heards of buffalo. (which I suppose, would give a traveler more
flexibility...assuming one installed a cow catcher in the front of
one's car :-)

I didn't mean to imply that the C-64 wasn't a "real computer". It was
just meant to separate a game only machine with one that had the
functionality of a so-called "real" computer (consisting of keyboard,
mass storage, end-user programmability and software availability for
non-game-playing use.)

I agree. Isn't it odd that Apple would follow this success with the
lame Apple IIc (and IIGS) keyboards? I guess even the best of
companies must occasionally pull defeat from the jaws of victory!

I did not know that (in my best Johny Carson impersonation). The
earliest Apple I had experience on was the II+.

What would occur before pressing reset? A garbled display?

Commodore 128 keyboards were quite nice. Certainly better than C-64
keyboards (which weren't terrible). However, I wouldn't consider the
C-128 keyboard to be the best. I, for one, have never gotten locked up
on any single keyboard. If I was to choose one to be "the best", it
would probably be IBM's early PS/2 keyboards. When I find 'em cheap
($3 or under) I picke 'em up. Other notables include the Atari ST
keyboard (as long as I can stay away from their attrocious mouse),
Amiga 2000 keyboard (mine died. Boo Hoo :-( ) and the Apple IIe
keyboard.

In the context of when Atari drives first came out (late 70's), it was
quite an unGodly amount of storage space. In comparison to Commodore's
1541 (over 2 years later) it sucked snake spit. The older Atari drives
could only accomplish FM (Frequency Modulated) data storage, whereas
the 1541 could (I believe) accomplish both MFM(?) (Modified Frequency
Modulation) and GCR (Group Code Modulation).

And remember, both Commodore and Atari DOS couldn't handle nested
directories. Apple's newer DOS could (PRODOS). (NOTE: I'm assuming
that the C64 and Atari DOS was later modified by third party
manufacturers to accomplish this).

Despite being junkier, I preferred the Atari XE keyboards over the
800/600XL ones (despite owning an XL and learning to touch type on it
long before getting my 130XE). Please note that there were at least 3
different 800/600XL manufactured keyboards...some being alot better
than others.

I wouldn't agree with your notion that the C-64 keyboards were worse
in physical quality than the XE line.

Nope. Not missing anything (unless you include the fuse box in the
basement).

As for reset/power up on the Atari, I loved the muffled rumbling sound
it would emit out of the television.

You're right. Pentium based computers must be an appliance. After all,
it acts as a heater, toaster, and fire alarm :-)

Computers should be designed as a series of layers. The upper layer
should be absolutely idiot proof. Lower, successive layers should give
more control to the experienced users.

I can't even imagine how my above explanation could ever be argued
against. But I'm sure it'll happen.

Listen,

Don't complain about IDE, its light years ahead in easy and compatibility compared to the good old days of MFM and RLL drives, this damned things and their controllers were horrible, everything was manual, you had to run special diagnostic software supplied on diskette and go into the controller card and configure the settings manually, no auto-sense their, and the drives were mostly incompatible with other makers and even different model numbers from the same manufacturer. SCSI may kick IDE's butt, but IDE is still a lot better then the good-ol' days.

The car industry also went through this transition. There was a time
when there were a multitude of car companies...each containing
nonstandard parts (well, that part still occurs ;-)). Most early
purchasers (late 1800's and early 1900's) had to know their car inside
and out in order to keep it roadworthy. This is no longer necessary
(if you don't mind being overcharged by $500 by an unscrupulous
mechanic).

No, spaces are insignificant with both Basic and DOS. "PR# 6" will be
caught by DOS (I'm sure about DOS 3.3, and I believe it's also true
under ProDOS). If you want the Basic PR#, you need to enter something
like ":PR#6" (the Basic : statement separator fools DOS). Or "1 PR#6"
and then "RUN".

It occurred to me that Aaron wrote in comp.sys.cbm:
> The older Atari drives
> could only accomplish FM (Frequency Modulated) data storage, whereas
> the 1541 could (I believe) accomplish both MFM(?) (Modified Frequency
> Modulation) and GCR (Group Code Modulation).

For the sake of correctness: the 1541 did not support MFM. The
1570 and 1571 drives did, but they were released much later,
to accompany the C128.

There are hacks for a 1541 to read MFM disks, though.

> And remember, both Commodore and Atari DOS couldn't handle nested
> directories. Apple's newer DOS could (PRODOS). (NOTE: I'm assuming
> that the C64 and Atari DOS was later modified by third party
> manufacturers to accomplish this).

The only commodore diskdrive I'm aware of that supports directories
(called "partitions", actually) is the 1581 (3.5" diskdrive)

Douglas Newbaur (have I spelled the name correct?) was one of those responsible for POKEY and SIO. He also wrote the astounding STAR RAIDERS. In an article in either ANTIC or ANALOG magazine, he claimed that the Atari's were originally intended on having a parallel bus but, I believe, Atari wanted to rush the computer to market (in time for the Christmas rush?) and opted for SIO only output. If he had known of this plan, he would have incorporated two separate SIO ports.

Actually, it was the fact that Atari made it point #1 that the computer be hooked to a TV set that killed the parallel bus slots in the 400/800 from the get go. The FCC had more heavily enforce rules back then for any device connecting to a TV set. So slots were out and that where the SIO bus came in for expansion. Originally the SIO bus was only supposed to be used for the cassette drive but then it was expanded for all peripherals. The Atari's were also sheilded in 1/16 inch thick sheilding making the units so heavy. Apple got around this small problem by not including an RF modulator, but instead having a 3rd part company sell it for them. The FCC still cracked down on them and after a heafty (fine/payoff) the FCC changed its classification rules for Part 15 compliance and for Class A and Class B devices.

Is Doug Newbaur one of the patent holders of USB?

Joe Decuir did an extensive amount of work on the SIO bus design and is now at Microsoft as part of the USB design team.

Amazingly, those computers are still being sold in Japan. I did a
double-take when I saw a lineup of Sharp models, never used, in the
display window of a computer store (in Osaka) earlier this month,
sitting right next to Palm Pilots, Color Zauruses and other hardware
a hundred times more powerful.

Actually,

It wasn't the 20 year Mac, it was Apple's 20th anniversary Macintosh to
celebrate Apple being in business for 20 years, the Mac was released in 1984
so a 20 yr Mac is still 5 years away.

I doubt "millions" of users actually programmed the C-64. This is
highly (and I mean HIGHLY) dubious.

>You must be a Win advocate, where the user remains as dumb as it
>can get. Simplicity....you call it.

Actually not (at least with Microsoft's Implementation). I find
Windows to be very befuddling because it gives the "appearance" of
simplicity without properly carrying it through. Adding
software/hardware to a PC and diagnosing other problems can be a major
(and I mean MAJOR) headache that Windows actually makes WORSE! Many,
many people (including a close friend) earn a livelyhood getting
people through Windows related problems.

Jason,

I would assume your talking about XIO commands and such??? Because unless you can't read which judging by how nice a website you have this cannot be true. Then you must not know about typing DOS and going to the Menu in the DOS' which are plain simple english. Depending on which version of SpartaDOS you have, the last revisions were MS-DOS-like.

I think anyone with any computer is going to need a manual to access direct I/O commands for hardware and would require a programmers reference of some sort, so this whole point is moot.

I've never owned (or even seen) a WebTV. If they're as cheap as A game machine, then I think Internet only systems have their place.

On, the other hand, I also wish to do more than one single thing with a computer. However, I still like to have a modicum of Initial ease of use in the same way that very few people want to etch a circuit board and solder a bunch of chips just so they can wordprocess, have internet access, program, etc. I doubt there's any person out there that exclusively use software/hardware that only that person built/programmed.

Also, even you like standardization. After all, the C-64 would have never had so much software or hardware available if each unit from the factory had widely varying (and incompatible) specs.

I DOTH RUB THY FACE IN MY SUCCESS!

Atari barely had a dos at all,and loading from disk? what kind of
lameness is that? oh yeah like pc, forgot... shit can make my 1541 load
60k in 15 secs, no problem

I don't think you've ever used an Atari then if your not familiar with Atari DOS,
they have some of the best DOS' available, even MS-DOS functional equivalent
versions of DOS. Also Atari's load data at much higher speed's then the C-64's so
I'm not quite certain you know both sides of the fence.

Actually,

All computing devices make that loading beep, I have an HP Kayak and if I listen to the speakers I can heard data loading and also hear a sort of whispering hiss when data is getting transferred to and from the internet when I'm on the modem, all it is, is the sound of data transfer. I always liked the load beeps of the Atari and missed them when I started work on IBM PC's and Mac's.

The best people for keyboards have always been Acorn. The BBC Micro range had good solid keyboards; responsive and reliable. Things have dropped off a little with the Archimedes and RiscPC. The best keyboard I have ever used is the Acorn Electron I bought at a car boot sale. The epitome of good keyboard consruction, it's about fifteen years old and works as well as my old one did the day we bought it.

No computer invented by man has ever done true 3D. 3D has only been simulated at varying degrees of artificial realism (and usually only on a small 2D area). In comparison to current technology, the ability of an 8-bit computer to simulate a 3 dimensional world is at the bottom of the totem pole.

A combination of bicycles and canoes can take you to any place a modern airliner can go (and with more flexibility). Does this mean that most people should opt for the previous modes of transport????

OK. I guess that, given a choice between two computers, a C64 and a Pentium, both being priced at $700, you'd opt for the C-64? After all, you did say both are capable of doing high speed 3D games/programs.

I'm thinking of selling the Brooklyn Bridge. Are you interested?

Not at all, simple type DOS and you were presented with a plain english Menu.
If you wanted to copy disks is you selected Copy Diskette and if gave you an
example syntax to follow for souce and destination. Need a diskette Formatted,
you selected that. Only things like loading Binaries and such I could see
where people would have to read, but Atari DOS was exceptionally simplistic and
much easier then other DOS which did nothing more then load up drivers and leave
the user to have to contend with crytic syntax commands.

The funny thing about Star Raiders was that the designer of the POKEY chip put it together simply as a demonstration of the capabilities of the machine. Obviously as a first try effort that was one heck of demonstration. Star Raiders is a classic which even today is a exceptional game to play.

Curt

Anthony Baker wrote:

And that's what I mean when I say that a Commodore drive's DOS is loaded as soon as you turn on the drive. You COULD just turn on the drive on an as-needed basis in the middle of a programming session or whatever.

That is a cool feature. What about using more updated DOS' ??? Did you have to take the drive in and have the ROM upgraded??? Or were newer versions distributed on diskette?

At least using DOS from a disk gave the true flexibility of being able to use any flavor you felt most comfortable with. There are dozens of version of Atari DOS' and with the excpetion of the horrible DOS 3.0, all of the DOS were compatible with one another and many gave users very advanced features and capabilites. Also the ability to autoload additional device drivers using a binary version of autoexec.bat

I remember seeing the first VIC-20 at this place called CompuTech, it was the first computer store I'd ever seen in a Mall before. I was rather impressed for what you got, I think the price was $299 at the time which was unbelievable cheap for a PC at the time, later I found out it only had 5K so I was quite disappointed.

I thought the initial question was how to access the hardware DIRECTLY
and not rely on a (slow) OS to perform such duties?

Just as easy on the Atari. Of course, this simplicity is due to having
a DIGITAL joystick capability. The Apple II series of computers (and
PC's) only had ANALOG JOYSTICKS, which complicated the code necessary
to support it at the register level. (unless one relied on canned
(read:slow) OS routines, which the Apple didn't have). Still, Atari's
paddle controllers (a more direct comparison to the Apple's analog
controllers) were much easier to support.

Also, all Atari joystick ports (4 on earlier models, 2 on later models) could handle analog paddles. I believe the C-64 could only handle 'em in one port. Am I wrong?

I know that some readers of this newsgroup collect Atari ephemera. I have found some items that I'm offering to anyone who wants them.

A sales counter display (rough size 8 x 14) advertising 20% offAtari ST systems to teachers, staff and college students.

Atari dealer news letter Issue 10 October 20, 1986 includes Atari's plan to issue stock.

A Guide to Computers in Education produced by Atari copyrighted 1982.

A circuit board (rough measure 3.5 x 2.5) labelled C010712 Rev. 5. I have no idea what this is and if it works (probably not)

I have also found advertising flyers from Compute! books for ST, B&C ComputerVisions, Happy Computers Super Discount Order form, APEX resources, Magic Sac Plus a Macintosh emulator for the ST.

Anyone who wants these is welcome to them. All I ask is the cost of postage from NY to where you are.

Thanks Jack

> dy bought by Commodore at that time.
>

Not correct, Atari had several projects in the works before the Tramiels bought the company, one was called "Sierra" which was a 68000 based system with a chipset called Silver & Gold which had unbelievable capabilities. Apparently it seems the Tramiels didnt know what they had or had the blinders on because they scoffed at the Atari Sierra and threw in the trash bins, unfortunately I tracked down the individual who had the 2 prototypes are stripped them down for the gold and memory and discarded the prototypes so they are lost for all time.

Atari also had the wirewraps completed on the motherboard and 256K expansion board for the Atari 1850XL which was to be the Atari system using the Amiga chipset before Commodore went and bought Amiga. The 1850XL was to use Modules which would plug into the read of the box and add modem, parallel, various vidoe and so forth. Also a high-end game console was planned, unfortunately 2 days before Amiga was due to deliver the chipset to Atari they repayed the loan they borrowed from Atari to develop the chipset and terminated the contract agreement with Atari.

The final system was the Atari 1650XLD which was to be an Atari 8-bit/IBM 80186 clone dual system. In was a joint effort with Toshiba. However which James Morgan took over the reigns from Ray Kassar the project was cancelled as part of his cost cutting initiative.

It wasn't until Atari released DOS-XE that it had nested directories so it
was up to DOS' like MYDOS and Spartados to allow nested directories on the
Atari's.

Yes, the placement of keys was a bit ackward I think on everyones keyboard
and yes the 1200XL keyboard hands down was the best, also with all the
variations of computers, Atari really should have done a detachable keyboard
and with the Atari 400/800 series Atari released the CX-85 number keypad
seperately so it was a little disappointing that Atari didn't see fit to
include a keypad in the XL series or XE series. The one thing I hated was
holding the control key to use the arrow keys to move around, very
annoying. The Commodore computers got a major facelift with the c-128 and
c-64-II's which were attractive and more functional and they replaced the
c-64 keyboard which was not a very good keyboard.

One unfortunate aspect of the Atari DOS menu system was it's lack of
easy accesssibility within a BASIC program. Something as simple as
getting a directory listing required weird XIO commands that I never
bothered to memorize.

The 1581 has partitions but no true directory structure. However, CMD devices (RAMLink, HD, FD) have true nested directories, and I wouldn't be too surprised if the Lt. Kernal supported them too.

Not really XIO, but it's not that easy.
OPEN #1,6,0,"D:*.*":FOR I=1 to 1E9:GET #1,A:? CHR$(A);:NEXT

which also results in an error message when it reaches the end of
directory.

But, doesn't LOAD "$",8:LIST ruin the program you are currently coding ?
Basic I mean
or do you talk about other cart features like Final cartridge or something.
Because, Spartados X can do a directory and still keep the program, but
it's an add on cart

You must be a very sophisticated operator. Didn't you know you could
hold SHIFT down do temporarily disable autoplay when you incert a CD?

Also, you can disable autoplay altogether permanently too if you like.
Autostarts ARE a feature. Likewise on the Atari you are not required
to boot anything. You must boot DOS in order to use disks. It
doesn't actually run a application though unless it is called
AUTORUN.SYS or STARTUP.BAT in case of SpartaDOS. The C64 also needs
to load in a DOS in order to use disks, it's just that it loads it in
from ROM inside the drive?

SpartaDOS X loads very quickly also since it is ROM based.

Don't paint all us Atarians alike. I have no problem with LOAD "$",8
myself. I sure do like SpartaDOS for the Atari better than any other
DOS for any other 8-bit though that I have seen. While I haven't seen
them all, I've see a lot. By the way, I think Atari's DOS kinda
sucked.

According to Derek Fern of Micro Discount (UK), Harlequin (the guys who wrote Plastron) bought the rights to Shadow of the Beast (and some other titles) and started the Atari 8-bit version.
Unfortunately, due to poor sales of their software, Harlequin decided to stop supporting the Atari and the game was never released.
Sadly, the source code is probably lost :(
By the way, the C64 version really rocks!

The Atari 400/600 were very nice quality. The XLs were of good
quality, the XEs were somewhat junky, and the CBM stuff was somewhere
a bit worse in physical quality than the Atari XE line.

Just my opinion. I think the technical aspects of the C64 place it on
par with the Atari line. Each different and excelling in different
areas. Over-all, I think the Atari is the better machine BUT it is a
close call and those who value some of the strengths of the C64 would
like it better over all.

It wasn't so much that it wasted the space (though it did by
comparison to SpartaDOS (which is godly efficient)), it was more that
there just wasn't much space on the format the drives did on the disk.
Atari's original drives only formatted 90K of space on a single side
of a floppy! How crappy can you get?

Your information is a little off. The Apple III came out in 1980, prior to the IBM PC. The ProFile HD was only available in 5 meg, the 10 meg didn't come out until 1983. You couldn't just switch the mechs, you also would need a different ROM.

The Apple III used the same bus as the II and many II interface cards worked in the III (some couldn't fit in the compartment). There was nothing wrong with the floppy drive, which was the same as the Disk II, one of the most reliable ever made.

The failure problem existed but was cured. The problem with the III is that it wasn't at all well-suited for its target market, which was business. It does have many nice features and quite a few are still working today.

1247. DIR2ATR and XDIR

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-25 00:00:00 UTC
From: stack@xs4all.nl
Message-ID: <36abc60b.17603200@news.xs4all.nl>
Source record: 55667

Hi All,

Iï¿½ve just finished my latest versions of DIR2ATR and XDIR and have
updated my homepage accordingly.

DIR2ATR
========
Version 5.03.00 lets you turn a pc directory
(or more pc directories in the case of Spartados)
into one or more .ATR or .XFD disk images.
It supports Single, Medium, Enhanced, Double, Quad, 720KB,
1.44 MB and 16 MB disk images.
The following OS-es are supported: Dos 2.5, MyDos 4.53,
and SpartaDos 3.3a.
Although the program is designed to accept BeWe Dos and
SpartaDos/X, the bootcode for them and the DOS.SYS are
not included in the archive.
Although I assume the program will work if you have them,
just put them in the correct directory (read the included .txt file).
The program accepts your own favourite DOS too, just use
the "MY OWN DOS" feature of the program.
Please note that the directories you are converting should
contain Atari XL/XE files and/or text files. Just a reminder.

XDIR
====
Version 10.04 now supports the disk images created
by the new version of DIR2ATR as well.
So SpartaDos disk images are correctly extracted as well now.

So download these new versions, and let me know what you think.
Regards,
Bo Schreurs

>I thought it was something like PR#6 or something like that?

That works in two cases:

- If you're using BASIC (either version, I think)

- If DOS has loaded and is intercepting commands

But the early versions of the][plunked you into the machine-language
monitor when you turned the machine on, and of course DOS hasn't loaded yet
(naturally -- you're attempting to load it), and <slot>^P is the monitor's
built-in command for sending output to slot <slot>. There's a command for
input too -- it might be <slot>^I. In BASIC, that would be IN#<slot>.

By the way, the two cases may overlap. If DOS is loaded, it usually sees
its PR#6 command before giving the command line to BASIC. But if you type
PR# 6 instead, you'll get the BASIC command, which is useful if DOS has been
fried. That can happen after heavy-duty or flaky programming. (A badly
pirated game crashing is a good example.)

The early]['s also plunked you into the monitor every time you pressed
RESET (there was no RAM reset vector you could change). This can be useful
for analyzing games but probably not many other times.

I like the Apple but I hope you Atari and Commodore people never have to
deal with these problems!

No 8-bit computer is truly complete without a bizarre reset or interrupt key.

I mean, in all this argument, I'm amazed nobody's chosen to go toe-to-toe on the "System Reset" of the Atari and the "Restore/Runstop+Restore" of the Commodore. (And, of course, the splinter war within the 64 fan camp of "Old-Style Whack-the-Restore-key" and "New-Style Soft-Press-Restore-Key")

By default, of course, the 64 does not have a true built-in hardware reset (the 128 does), but almost every utility cartridge corrected that oversight.

On the other hand, while I appreciate to some extent how the Atari's reset button was used, I wish I knew how to get a true reset out of it ala the Apple without powering down. Am I missing a key combination, guys?

HI!
I came across this string and thought I would say something. Are we
talking about the CPU or the graphics chip? The graphics chip was put to good
use and it had to be one of the best graphics chips in a home computer at that
time. Colecovision, which is usually said to have the best graphics, used the
TMS9918A which was the same as the TI-99/4A's graphics chip. A really good
computer was the TI-99/8 since it used the TMS9918ANL graphics chip and the
TMS9995 microprocessor. It also ran at 10Mhz. and had Pascal and TI Extended
BASIC II built in the console. It's too bad TI decided to not release the 99/8
since it would have sold for $600 and that would be money well spent.

Sincerely,

Bryan Roppolo

Ok, It was wrong of me to write this about atarians being stupid, it was
not meant to be a serious charge :) But anyway.. But my main point is (as
many others already have stated) that sure c64 lacked the possibility
to autostart a disk, but i prefer having a dos where i can control most of
the things going on. And not have the stupid computer to start a disk as
soon as I put it into the drive.

I read somewhere that when William Mensch upgraded the 65816 to
either 10 or 14 Mhz in the late 1980's Apple flatly refused
to incorporate it in the 2GS (which was using a slower 3.?Mhz 65816).
Maybe it had something to do with having a non-Mac Apple computer that
could outgun their more expensive 7Mhz Macs. Either way, Apple
could have had a very nice (and at last!) speedy 2GS, but decided
not to continue development of the line.
When I think of all that beautiful hardware and O/S running at a
measly 3Mhz I want to cry (specially since I own one of them :-).

I agree one-hundred percent. The PC could be a much more powerful system if we weren't wasting half of it's resources trying to make pretty graphics. That's one of the reasons a Macintosh running at 266mhz is comparable to a Pentium running at 400-450mhz, the PC was never designed to be a graphical system in the first place.

My father bought me a c64 when I was about five or six. I had a couple cartridges, a datasette, and a black and white television. Most people bought computers then with the idea that a computer was going to be a computer and to make it do anything of worth you had to use your mind. If you were old enough to read the label on the disk you could certainly figure out how to load a program on a Commodore.

I'm not totally against the idea of simplifying the computer process, who doesn't want something simple? The problem is that 90% of the people who are purchasing PC's today don't understand the origins of the systems they're on. If they were even alive when the c64 was vibrant they probably would turn their noses up at it and say "this is for nerds and losers." As early as 1993 the internet was still a wonderful resource. Since the media has bastardized it however, it's turned into a realm of thirteen-year-olds hungry for porn and teen chats.

I'm don't mean to spew the newsgroups with useless chat, I just felt this was
a fine time to get something off my chest. :)

In the Atari, the Display List Interrupts are kind of integral in the system. Even though the memory for each player is contiguous bytes, at anytime during the display you can have the horizontal player 'band' move to any postion on or off screen.

Don't know if you have seen the Star Raiders type display on the C64 or Windows now for that matter, but the screen full of stars that you move through has been done using this technique. Never bothered to count, but I would imagine the there is no difference between the sprites version & Player Missle Graphics version.
> 16 colors on the same raster line, for playing different waveforms,
Kind of a straw man arguement isn't it? I mean an Atari could have something like 24 different colors on screen at once by just chosing a graphics mode with text window with P/M graphics enabled. Not even a single line of machine code needed. Butt ugly & not really used.

More relevant & something I would like to know. Just exactly what are the minimum and maximum amounts of ram for the display?

Atari goes from chr graphics with ~240<?> bytes up to a bit map 40 bytes by ~200 lines<192 if you want to get technical & use a TV, overscan thing>.

> or for timer-based interrupts? What effect would a given workaround
Atari has timer based interrupts coming out the kazoo. Both the Pokey, Pot keyboard sound timer serial chip, and the Antic, alpha nummeric telivsion interface<? god it has been a while!> chips have interrupts occuring all over the place. Kind of like having a couple of RIOT chips, but more sophisticated.
> have on the system or program performance?
You have to pay the band if you want to dance.
BTW: Thanks for the other post on C64 device independance, it was exactly what I was looking for. I responded to Robin since I got his message in my newsreader first, but your post was very imformative.

Trying to think of the ref, could have been Zaks "Programming the 6502" or Levanthal, which I think predates both the Atari & C64, but there is a call for device independant I/O. Neither an Atari or C64 innovation.

Yeah, and most of that code is taken up by useless repetition of
RASTER INTERRUPTS! (JOKE). Please define the word "...and no two are
the same?" Does this mean all Pac-man derivatives are not included in
the aforementioned 3 gigs?

Of course, I'm getting a little outrageous here. 3 Gigs, in fact, is a
commendable amount for an 8-bit. Why, that must be an equivalent
amount of data to about a dozen current PC games! INCREDIBLE! :-) In a
way, that amount of data is a bit depressing. I had delusions of
buying a single CD of C-64 "warez" off the net (containing about 4,000
different programs) which would contain the majority of progs that
ever existed. Now *sniff* I know that's not possible! Oh, the joys
(and headaches) of collecting.

The DOS remains inside the drive, actually. No 'loading' part involved,
since it is _executed_ from ROM.

This whole discussion reminds me of the old Sharp MZ-series. They
had to boot BASIC from _tape_ (which was a rather time-consuming
process, I can tell you that!). Heck, they didn't have a built-in DOS.
Only a monitor.

PR#6 from Basic, 6^P (or C600G) from the Monitor. But since RESET took
you to the monitor, it was faster to do 6^P than to go back to Basic
(with ^B) and do a PR#6 from there.

Even new PC keyboards? PC keyboards sold today are amazingly bad,
with only a very few exceptions.

The best keyboard I've ever used was on a top-of-the-line Canon
dedicated wordprocessor in 1986 or so. I would pay a lot of money
for a PC keyboard with the same quality.

Next is my Apple IIe keyboard. Then the no-name extended keyboard
that came with my 386-25 clone in 1990. Then the original Mac SE
keyboard (nice layout, not quite springy enough). Then a Fujitsu PC
keyboard I bought at a swap meet, and which is my main keyboard
these days. Then the original IBM Lexmark (a bit too clicky for my
taste, though). I seem to remember liking the NeXT keyboard, but
I didn't use it long enough to really tell.

I would occasionally hear about the following (somewhat hazy about the facts) story (is it true?).

During an Apple stockholder's meeting (in either 1987-88) John Sculley, the CEOof Apple, when asked about producing faster IIGS's, flatly denied the existense of any faster 65816 processors. William Mensch(?) then promplty stood up from the crowd, held up a bag of (of what he claimed was) fast 65816 processors, and essentially called Sculley a liar.Needless to say, Apple security dragged him out of the auditorium faster than a Clinton climax.

Excellent explaination. If I remember correctly, one could have up to
8 devices open at once without modifying the Handler Address Table.
Without relying on any manuals I seem to remember the following:

Handler Address Table consists of 128 bytes (on page 3?) whichis
subdivided into 8 regions of 16 bytes each. Each of these 16 bytes
(within any of the 8 regions) would allow a program to pass different
pieces of information to the OS(such as beginning address of bytes to
move, length of byte string, line draw and AREA FILL, etc).

How right/wrong are my recollections?

> this a "simple workaround".
Yes, but not exactly what I was trying to point out. Usually, the point
is made that the C64 has more sprites. But in practice with DLIs you can
essentially divide the Player Missles of an Atari just about any way you
wish. I know what you mean by software sprites & that is not what I am
talking about. Pretty common technique. Let me see if I can give an
example that makes sense.

The P/M have a single byte in a hardware register determines their
horizontal position. If nothing is done with the DLIs to modify this, it
would appear as a single band greater then the height of the screen,
i.e.
*
*
*
*
But as Aaron said in his posts about DLIs, there is a vector the system
will jump through during the display & return control back to the 6502.
So, what many people did was just divide the screen into different zones
let's say as far as their game design went. The DLI routines were always
very simple, as simple as changing the horizontal register to a new
position where approprate such that you could have the same PM
displayed, flicker free-no software moves, in multiple locations. Like
*

*
*
*
With each of the '* representing a different slice of the same P/M
memory. That is, the first '* if it used the bitmap for an 'A would
appear as an A on the left of the screen, 8 bytes further into P/M
memory you put the bitmap for a 'B & that would appear on the right of
the screen.

Maybe someone can bail me out here, I know how it is done, but reading
my explaination is confusing to even me.

The bottom line is you could actually divide the 4 Players anyway you
liked. That is, if you needed a 4 Players the size of the screen, you
could, if you needed 4 Players each one scan line high or 800 Players
like in a starfield demo, you could. The overhead of this would be
significant, that is changing the horizontal position registers 800
times every 1/60th of a second, but still better then a block move.

P/M had other problems that made them less useful, for instance the fact
that a single Player could only be one color on a scan line, only 4 of
them unless you want to combine the missles into anther player.
>
> >> 16 colors on the same raster line, for playing different waveforms,

> But what is important here is that they are all on the same horizontal
> line, without any exceptional programming effort. I mentioned the
OK, this is where I disagree. I will say it is a straight trade off.
That is, C64 users say "16 colors on a scan line" while Atari users say
"256 colors in vertical"

See my point? Why are more colors in the horizontal plane more important
then 16 times as many colors in the vertical? I say it is a straight
trade off with no clear winner. Hell, we could all just stand our
monitors on their sides & claim the ability to do 200 colors on a scan
line.

> ability to have different colored text. But consider a game like
> Ultima, which has different character-blocks which represent grass,
Ulitma on the Atari was ugly. It used a 320X192 bit mapped display with
artifacted colors. This IMO was not the way to go, but probably made the
port from the Apple easier. As far as games go, Ultima on the 64 had to
win this one.
> towns, monsters, ocean, and so on -- each can use different colors,
> without any restrictions. Then consider a game like The Bard's Tale,
> or Hacker, in which the screen is made up of different "windows", like:
Atari has them too, for the record, I programmed a version of Rogue that
used one of the Atari 5 color chrs sets to simulate the dungeons pretty

closely to the way they were implemented in Ulitma III. Most everyone
that saw it said it was superior to Ultima III as far as grahics.

Don't know if you have ever seen it, but the Atari version of Joust is
one of these redefined chr sets. Pretty colorful, I don't think more
colors would add to it.

I do like the side by side mix of graphics & data. Once again, it just
means you have to format your display a little different. That is,
instead of:

graphics text graphics

you have to

graphics
text
graphics

Unless you want some severe restrictions on the Atari. I could never
adjust to having the equivalent of quadrupple wide chrs on the Atari
when mixing the two on the same screen.

It was done very well with the Alternate Reality series of games. For
me, it turned out the game was better then anything running it. Nothing
wrong with the different orientation.

<some snippage>

> > 12345 cycles? (I am indeed curious about this).
I think Aaron covered this in his post. Kind of hope so, since it is one
of the things I have not done. It is not trivial IIRC since you can use
divisors. i.e. system clock/16 or system clock, or whatever. If you

think of one of the custom chips that handle it, Pokey, as just putting design from a keyboard encoder, serial chip, RIOT, sound, all on the same chip & you have the Pokey.

Assuming you have it set up right *which* I have no idea which hoops to jump through, then it is just store the 12345 in the Pokey 16 bit hardware registers. The interupt generated when it finishes is pretty much standard 6502, poll the devices to see who wants want & why. Bits set in flag register of Pokey for type of IRQ since it generates everything from keyboard to serial interupts. Maybe a 6522 VIA or 6526 would be a better example of the combined silicon on the chip then a serial chip like the 6551.

Saw an AIM-65 about a year ago in a surplus wharehouse. I did just get a
Synertek KTM-3 to look at. Power supply fried, but managed to get it up
& displaying garbage on the screen after fixing that.

Stunningly simple design as far as I can see. Dual 6502s in it, I assume
one is for keyboard scan. Best part looks like they managed to get an 80
column display by only using a chr ROM & two or three counter chips with
a 74LS166 parallel to serial chip. Looks like they just clock the '166
with a 14.318 mHz crystal, & used the counter chips to derive everything
from the system clock, to sync.

1270. unARC on a PC

Anyone know where I can get a utility to unarc an arc'ed Atari file on a PC? I downloaded 2 files... s/b text... and would like to open them here..
Thanks..
Vinnie

Does anyone have available the bit settings for accessing via the OS and ANTIC the "extended" RAM of the 256K and/or higher XL/XE computers? I have the settings for the 130XE's 128K scheme, but need it up to the 1088K bank (PORTB settings)

It practically were in the millions. Same thing happened with the
Atari, and I guess with all of the 8 bits released back in those
times.

For sure a computer was bought in those days, because of their
games capabilities, but most people wanted to know whta
"programming" was all about.

> >You must be a Win advocate, where the user remains as dumb as it

So then it isn't simple.

The point of this topic, is that neither with Atari nor Commodore
was "easy" to begin pounding at the board. At the very least you
had to read in order to make the computer do something... ;-)

> from ROM inside the drive?

Of course it does not need to *load* any Dos. The C64 has all routines it needs for peripheral access in the C64's Rom, and the Serial devices used with the C64 have all the routines they need to operate on thier own in their own ROM.
Pure Plug and Play.

You could even program 2 drives to copy a disc from one drive to another and pull out the serial cable that connects the Floppies with the computer.. and they still did the job on their own (..done in one Copy-Program of the Fast Hack'em series, btw.).

But C-64 fans have one :)
the reason why most of us have a Cartridge in their slot that performs a
directory (or CAT as CPC-dudes would call it), by pressing a funktion key
like F3 or entering @$

The Action Replay Cartridge e.g. autostarts the first programm in the
directory when you press F1.. so for those game kids it is just:
Insert disc,
Switch on
press F1.
Play

No "big" difference to an Autoboot in my opinion :)

Hm, do yu know anyone that hasn't ever tried to enter:

```
10 print "hello"
20 goto 10
```

On any BASIC-programmable computer?

I know no one..
For this reason nearly everyone who bought such a decent machine that
shows a basic prompt on startup actually programmed his beloved keycase..
And if it was only 2 lines copied from the manual..

On the other hand I know a damn lot of people who did not even code a
single line on their PC in a period of 5 or 7 Years...

> interlaced flexible line integration, also afli, bfli, shifli, shi, shfli,
> shflixl, itbmap, and many others, which all add colors/res in different
> increments!

Sorry to correct you with that.
FLI = Flexible Line Interpretation
IFLI = Interlaced Flexible Line Interpretation
UFLI = Underlay Flexible Line Interpretation (Sprite Underlayed)
AFLI = Advanced Flexible Line Interprtation, also called HI-FLI (High-resolution Flexible Line Interpretation)
HIFLI = High-resolution Interlace Flexible Line Interpretation
Shi (SuperHires) = Hires Character-set + Matrix with Sprite-Overlay.

Hires modes have a pixel-resolution of 320x200 pixel naturally - the color resoluton is 2 colors per 8x8 pixel card.
Multicolor modes have a pixel-resolution of 160x200 pixel - the color resolution is 3 different colors per 4x8 pixel card, and one global color per pixel line.

Hires FLI-Modes only have the left 3 colums in two colors, while the rest of the colums have a color-resolution of 2 different but absolutely independent colors per 8x1 pixel card.

Usual FLI Modes (based on the Multicolor-mode) have a pixel-resolution of 160x200 pixel, the left 3 colums are 2 colored, the rest of the 40 colums has a color-resolution of 3 totally independent colors per 4x1 pixel card including 1 common color for the whole (pixel-) line.

With Interlace modes you virtually increase the number of colors (taking the disadvantage of 25 Hz flickers in badly-chosen colors) and virtually double the resolution.

UFLI is even crazier. It is based on the usual FLI Mode, but has "stretched sprites" between background color and pixel color.
That means UFLI has a resolution of 160x200 pixel, but a color resolution of 4 independent colors per 4x1 pixel-card.

The craziest mode however is IUFLI, that virtually increases the number of colors and doubles the resolution to 320x200 by interlacing the usual

UFLI mode... it has a color resolution of 4 different colors (plus their
mixtures) per 8x1 pixel card.

Those routines were found by tricky programmers, just like the FLI-
Graphic-Modes. You probably don't find them in a book, as they are things
the original C-64 inventors didn't even think of they were possible when
they brought my beloved breadcase to life.
The routines are based on the reactions of the Video Interface Chip (VIC)
when "faking" him with setting internal flags manually at unusual times.
However. Funet is a good archive to find the routines for that.

> Basic blows, learn to code.

Don't say that... Nearly all the 8 bit people have that very special
kind of "BASIC instinct" :))

> Can you move a 320*200*120 piccy around the screen in any direction in

> >
> big whoop, I got 20mhz :)

Not outta the box Fungus... that is one thing you have to acknowledge,
when comparing an 8bit Atari to an 8 bit Commodore - we have to compare
stock machines.
However, our Stock-C64 can be enhanced to a 20Mhz 65816 driven 16
Megabyte PS/2 RAMmed Monster.. I'm sure if Atarians developed with about
the same power than the Commies did, they'd probably have a SCPU too.

I'm glad we don't have to argue about which processor is superior.. :)))
As I always say: All 8 bits had their advantages.
The Atari surely had the huge amount of colors and the higher clock-

frequency, but it lacked color-density sound and sprite.. also a proper
DOS installed in the ROM right outta the box would have suited him good.

Okay apology accepted. Now though I think you slightly
misunderstand... the Atari (nor Apple) automatically start a disk when
it is put into the drive. They merely start the disk if it is already
in the drive when the computer is powered on. It does not function
like the auto insert functions of Win9x.

Try swaping in and out the LSI, the large Antic, Pokey, PIA,
CPU, GTIA. Then the ROMs, maybe. Not very sophisicated,
but if you can get another XL/XE, or even 800/400, you
could try that.

IIRC (and maybe I don't), it was worse than that. The BASIC interpreter
was written in the GPL interpreter and kept in a crunched form in ROM.
Also the ROM's were auto addressing.

I think you misunderstand how rasters work, although you would have to
have a couple of splits running for, say, a change between screen modes
the actual time taken to do this would be a fraction of a scanline. In
fact, it'll run in about two thirds of a badline, so it's *hardly*
processor intensive.

And since the system is running the IRQ interrupt *anyway* y'might as
well *use* it! =-)

Not being an Outer Limits fan, no. *But* I *have* paid to see old films at the cinema in the past and I *do* buy videos of classic films and television.

My favourite sci-fi show (still no name, I'm not taking the risk!) ran for over 25 years and I have *most* of it on tape, commercial copies where they're released and off-airs where not. Considering that comes to several hundred tapes, even the costs of blanks for the off-airs is something I probably don't want to scare myself with.

It's *not* 'Trek, BTW.

> Most everyone adores the 1939 Wizard of Oz & Gone with the Wind movies

Because they're now available to own in your own home, why would people pay to see what they already own?

Take a look at Disney though, they rationed video releases and used the few they *did* put out as "bait" so that cinema re-releases of their classics pulled some very respectable box office figures.

Considering that 25 million units were sold and all my friends that had a C64 at least sat down and wrote some simple basic programs (INPUT"WHAT'S YOUR NAME";A$:PRINT"HELLO ";A$:) and typed in the examples in the manual, this does seem likely. 10% of all C64 users means 2.5 million people, not counting the fact that often more than one person used the computer.

Hi Geoff-
I have both C64 and A8 stuff. I'm interested
in these extremely fast, fast loaders. Can you
tell me where I might get some more info and
perhaps buy one. I have Jiffy Dos on my
64/128 stuff, and I must admit I'm curious
about 35X and 40X fast loaders, since that
puts the speed right in the range of a 64
parallel hard drive. (Baseline of a NTSC
64/1541.) If you can provide any contact
info, I'd appreciate it.
Thanks,
Larry

That's always been the 'myth' of Star Raiders, that it started as an
8bit demo, but according to Doug Neubauer he had intended to make a
game all along. This is from the 1986 Analog interview:

"Star Raiders was to be a 3-D version of the Star Trek games played on
the mainframe computers of that time. The Star Trek game was all text
and not played in real time, but it had the idea of ship damage and
sector scanners and charts.

It also used names like 'commander' or 'super commander', which gave
me the idea of a rating rather than a score. While at National
Semiconductor, I did up some demo screens of star backgrounds, and the
whole thing seemed feasible- but I didn't get to implement it until a
couple of years later."

Doesn't the 6502 in the Atari's have a "reset" line? Would it not be
a relatively simple task to install a real hardware reset? Curt, Bob,
Mathey, anyone?

Oh yeah, before I forget the thread here and lest anyone get religious
on me, I do mean to include the commie or apple also if the 65xx
series CPU they have also have a reset pin. I am a firm beliver in a
hardware reset switch. Power cycling is hard on equipment and more
time consuming.

The CMD HD is 64K. The user guide/programmer's manual really goes all out to describe what is in effect the computer inside the hard drive, how it works, and how it can be programmed. Too bad not many have taken advantage of it.

Most PC keyboards out there today are kinda sucky really. There are really good ones available though and they are the best on earth in my opinion. For example, as I type this I am using a genuine IBM AT style keyboard with the full mechanical switches. My PC isn't IBM of course... but hey, their keyboards do rule.

I'm sorry if I didn't clarify better.... I was not refering to
keyboards but equipment quality in general. I see how I was easily
misunderstood because the text I was responding to was a bit more
concerned with the keyboards. As to just keyboards I would say the
1200XL had the best, and the 800 being second, then XLs and XEs last.
I do not remember the C64 keyboard that well but I think I would put
it between an XL (not 1200) and an 800.

Hi Steve-
Like most all of these comparisons, it finally
boils down to personal preference.
For instance, I wouldn't think of not using
the Jiffy Dos wedge with my 64. But I've
always lamented the fact that even though
Commodore went to the trouble
to include a wedge originally, they could have
used a couple more KBytes and had a well
functioning menu. I've seen several add-on
menus over the years, but they never
seemed to catch on. Didn't one of the
fast loader/multi-purpose carts have a menu?
Can't remember for sure.
Now where's that stack of blank floppies... :-)

That depends on what you mean by "not a very good keyboard". I have a 10+ year old keyboard for one of my c64's and it still works perfectly, anyone here care to compare? Also - the c64 keyboard had a far better key layout than the apple (1,2 series) keyboard. I especially like how ultima 6 for the c64 used the keyboard layout to allow for 8 directional game control without getting in the way of alpha-numeric keys. Hmmm, that reminds me - I am going to throw something else into the mix, 8 bit ataris and 8 bit apples have no ultima 6 game for their systems, yet another benefit for owning a c64. By the way - you can also use a joystick with ultima 6 for the c64 of course but the keyboard provides more accuracy (for diagonal control for example).

An Apple II with Applesoft ROMs (i.e., almost all of them) has
paddle/joystick-reading routines in ROM. They are callable from
Basic with the PDL(0) and PDL(1) calls.

To read the buttons, you have to PEEK somewhere in the $C0 page.
MSB set means button down.

...and other 6502-based single-board computers which came later
and improved on the KIM-1 in various ways.

I have a Synertek SYM-1 my college physics teacher gave me, and I'm
looking for a Rockwell AIM-65.

I've wanted a BBC Micro ever since I saw listings of programs
written in its very advanced Basic (for the time), in the mid-80s.
Now I want one even more. Were they ever sold in North America?

WARNING: TECHNICAL INFORMATION AHEAD. PROCEED AT YOUR OWN RISK!
(It is not meant to be entirely accurate. corrections will be
appreciated.)

There's a very simple (albeit C64 programmers apparently consider
unimportant) difference.

A C-64 RASTER INTERRUPT is accomplished by POKING a C-64 hardware
register with a specific number that corresponds to which TV/Monitor
scanline the interrupt should occur. For multiple interrupts (on the
same screen) multiple POKES to the same register must occur (which
must be changed by the previously occuring interrupt).

The Atari's normal method of generating an interrupt at the end of a
scanline is different. Before it's understood, one must understand the
Atari's DISPLAY LIST which is interpreted by the ANTIC chip.

To produce a full screen graphics (or text) display on a C-64, a small
number of hardware registers must be POKED...and that's it. The
slightly unfortunate aspect of this *simplicity*is that the C-64 is
unable to mix multiple graphics modes without generating processor
intensive RASTER INTERRUPTS (which must occur 60 times a second).

Unlike the C-64, there is no single register that tells the Atari
hardware how to automatically generate a full screen display. Instead,
the OS (or other user installed program) must first set up a DISPLAY
LIST somewhere in memory. This DISPLAY LIST is nothing but a
sequential series of BYTES which defines how each horizontal strip of
graphics (or text) will be displayed. The following DISPLAY LIST sets

up a 10 row text display

```
70
70
42 display ANTIC mode 2 (BASIC mode0)
20 Also, screen memory starts at7C20
7C
02
02
02
02
02
02
02
02
02
41
E0
7B
```

The first two bytes (70 70) causes ANTIC to generate 16 blank lines. (Manipulating this can cause the screen to be pushed up or down and its effect is shown in the Jumpman game when your man falls, hitting the girders on the way down.)

The upper and lower nybble of the next byte (42) tells ANTIC to display the first line of graphics (lower nybble: 2) & to use the next two bytes (20 7C) as the starting address for the actual graphics data (upper nybble: 4).

The next 9 lines (02 02 02 02 02 02 02 02 02) tells ANTIC to display 9 additional (ANTIC text mode 2) lines.

The next byte (41) tells ANTIC that no more graphics data will be displayed on the current screen and to use the following two bytes (EO 7B) as the address to the beginning of the next DISPLAY LIST (for the next screen display). Normally, this address will point to the beginning of the same DISPLAY LIST but could point to a series of others in order to produce full screen animation without any further processor intervention.

THE FOLLOWING INFO SHOWS HOW THE ANTIC CHIP INTERPRETS EACH BIT WITHIN A BYTE OF A DISPLAY LIST:

bits 7 6 5 4 3 2 1 0

A combination of bits 0 through 3 define what graphics (or text) mode will be displayed on the current line. A graphics mode line can control just one scanline or it can (in the case of text) control 8 (or more) scanlines. (NOTE: setting only bit 0 (out of the lower 4 bits) produces a single blank scanline containing no graphics data)

Bits 4 & 5 allow for a combination of horizontal/vertical fine scrolling for that specific line. (the amount of fine scrolling is controlled by a hardware register)

Bit 6 produces an LMS (Load Memory Scan). This tells ANTIC to use the next 2 bytes as a new beggining address for graphics data.

bit 7 causes a DLI (Display List Interrupt) for that line. This is essentially equivalent to a C-64 RASTER INTERRUPT.

In the above DISPLAY LIST example, setting bit 7 (decimal 128 or hex 70) to any of the 02's (ie. changing $02 to $72) will generate an interrupt for the beginning of that graphics line.

Simple DISPLAY LISTS can consume as little as a dozen bytes or complicated ones as much as hundreds of bytes, depending on how sophisticated the graphics display should be.

Taking advantage of the DISPLAY LIST method allows for other powerful trickeries. For example. generating a LMS (Load Memory Scan) for every graphics line allows ANTIC to display graphics data from completely different areas of memory. If each of these LMS enabled lines are set to jump 300 bytes past the previous LMS enabled line, the screen display could effectively be horizontally scrolled 300 bytes (minus the amount of bytes being displayed) without processor intensive graphics data movement (which, unfortunately, the C-64 would need to perform).

The philosphy behind the Atari method for graphics display was to reduce the memory overhead associated with a computer display. Remember, the Atari was designed when even 16K of memory was awefully expensive. Hence, the Atari's graphics chips had to be extremely flexible in order to support a minimum RAM requirement. The C-64 design goal did not have to deal with this RAM problem and, therefore, it's graphics chip was designed differently.

This in no way means that the Atari is a better computer than the C-64...only that it allows for certain hardware based methods that the C-64 does not have. Of course, the C-64 also has important resources that the Atari lacks. It would have been great to see an upgrade path (for either the C-64 or Atari) that incorporated the advantages of both systems (with additions that neither had).

1312. Atari 1200XL still boots up to green screen, but not totally unresponsive

Newsgroup: comp.sys.atari.8bit

Source record: 55605

Sorry to report this message, but posts from my school's server don't seem to be getting out.

A couple weeks again I posted about an Atari 1200XL that just booted up to solid green screen. I've since replaced the memory chips (several times), the CO14806 MPU and the CO6060 MMU. I've also resocketed all IC's, just in case there was a corroded contact somewhere. However, all this appears to have had no significant effect. The TV screen is still green, regardless of the presence of a cartridge or any button pressed (including the reset button).

Although, I notice now that there are faint, dark vertical lines in the green screen every 1/4 or 1/2 inch. When I hold down the reset button, these lines all become evenly spaced at about 1/4 inch, and when I release the reset button, the lines go back to their previous configuration about 1/3 sec after the button is released. Futhermore, when I connect a joystick to either port and jiggle it around, pressing its fire button, I see intermittent white dots (noise/static?) zip across the screen. These lines and joystick noise appear regardless of whether a cartidge is inserted.

If anything, the fact that the faint vertical lines appear to change position when the resent button is pressed and only go back to their previous positions a short time AFTER the button is released should indicate that computer is doing something. That is, the computer appears to repsond in some way to the reset button.

Does all this perhaps better specify where my problem could be, especially since I've already replaced the memory, the MPU, and the memory decoder chip?

Thank You
Benjamn West.

My definition of true 3D would probably be comparable to the holodecks
on Star Trek. For "real time" display, the current computer technology
only allows for the tanslation of a 3D world onto a 2 dimensional
surface (or, in the case of VR style glasses, a couple of 2D
surfaces).

Quite possibly, I could be wrong. I'll have to keep tuning into
X-Files for any government conspiracies to cover up the truth. :-)

What about the Apple II's weird BASIC editing methods? First you had
to hit the "esc" key. Then, for cursor movement, one needed to hit the
"I", "J", "K","L" keys to reach the beginning of the line requiring
editing and, finally, hit the "return" key. This was still necessary
despite the incorporation of the arrow keys in later models (beginning
with the Apple II+?).

The C-64 can achieve more with it's limiting 16 color palette on the
same scan line at a higher resolution than the Atari. The Atari can
produce a more lively "effects show" with it's greater range of colors
but at a lower resolution. In these respects, both systems have their
individual strengths and weaknesses which good programmers should take
advantage of.

>Perhaps I should be more specific: I want to control the timer. Could
>you provide a piece of code which generates an interrupt every

>
The following piece of info was taken from DE REY ATARI. The book, in
its entirety, can be located on the net at:

http://www.pcc.net/dzone/dere/contents.html

(SORRY: I was unable to locate a more truncated piece of code and am
currently way too lazy to come up with my own).

Hardware Timers

There are four countdown timers built into the POKEY chip. They
function as reusable "hardware subroutines". The most common
use of these timers is in conjunction with the audio channels for
producing sound effects (see Section 7, Sound). They may also be
used as straight countdown timers, since they generate an IRQ
interrupt (see subsection on Interrupt Processing Structure). Each
timer is associated with a frequency register which holds the initial
value for the timer. When the hardware register STIMER is written
to, this initial value is loaded and the countdown timer started. When
the timer counts down to zero, an IRQ Interrupt request is
generated. It is important to note that only timers 1, 2 and 4 have
interrupt vectors for processing. The following steps must be taken
to activate any of the timers.

Step 1. Set AUDCTL [$D208] with proper value to select clocking frequency for the desired timer.

Step 2. Set the volume output to 0 for the audio channel associated with the selected timer (AUDC1, AUDC2, AUDC4 [$D201, $D203, $D207]).

Step 3. Set AUDF1 , AUDF2 or AUDF4 [$D200, $D202, $D206] with the desired number of clock intervals to count.

Step 4. Set up routine to process timer interrupt.

Step 5. Change timer interrupt vector to point to processing code (VTIMR1, VTIMR2, VTIMR4 [$0210, $0212, $0214]). *** Note. Due to a bug in the source code, the original version of the operating system will never vector through VTIMR4. This has been fixed in Rev. B.

Step 6. Set bits 0, 1 or 2 in IRQEN and the OS shadow POKMSK [$D20E and $0010] to enable interrupts from timers 1, 2 or 4.

Step 7. Write any value to register STIMER [$D209] to load and start the count down timers.

One complication of working with these timers is that the 6502's response to them will be pre-empted and possibly delayed by ANTIC's direct memory access, display list interrupts or vertical blank processing.

Well, Commodore equipment (including 1541's) had a very high failure
rate. I would assume the original owners of dead 1541's would find
some way of making use of them. Ass plugging would be a pretty good
method of discarding them. Don'tya think?

(I'm getting way too ludicrous. Still, the above comment is a real
"corker". ;-)

(I can't believe I said that.)

I guess that would mean you'd be willing to spend money at the theatre
in order to see an old b&w Outer Limits episode? I *mostly* agree
with your above assessments (in fact, I had pretty much made an
equivalent post) but when it comes to spending the big bucks, we
humans want something new and hi-tech. Most everyone adores the 1939
Wizard of Oz & Gone with the Wind movies and considers them to be
timeless classics...but this, in itself, wasn't enough to drag
millions of paying customers into the theatres when they were recently
re-issued.

Memory doesn't have to be a problem. (I'm developing a 1MB SIMM upgrade. The hardware works, but it's a lot of soldering. And MyDOS does something funny when booting with basic).

I've heard of plans (don't know ANY details) to sample (for use on CD's, not with computers) only that part of the sound that man can hear. And I do not mean below 20Hz and above 20kHz. If a lot of sounds are produced, you will not hear all of them. This is because lower frequencies need less volume to be heard as high frequencies do. Oops, I GUESS that should be the other way around. Maybe this is worth thinking about too.

Maybe 6 million computers, but about 30 million 8-Bit video consoles !!
(VCS 2600 !! Only a few 5200 and 7800). Perhaps another reason for no
better support to the 8 Bit computer line, those consoles were a
self-seller... Andreas

Hello Atarians,
this newsgroup debated some time ago about documentations for the Atari 8 Bit computers. Now, up to date many 800/XL/XE do not work anymore, some of them only because one chip is defective. It maybe is not hard to get a new chip, but how can we built one on our own ?? There is no unlimited source for getting used chips (sometimes you have to use a complete computer just to get one chip). so now, are there any documentations around for the Atari chips called "Antic", "Pokey", "GTIA", "PIA", so one can burn/make them for himself ?

To give away an idea to the emulator fans: If you could re-create those 8-bit chips, you could maybe build up an 8-Bit card, containing those original chips, that can be installed and used (like a graphic or sound card) on your PC with any emulator. So, instead of emulating these 8-Bit computers, you easily install a card for Atari, Commodore, Sinclair, Spectrum, Apple, Amstrad, and many other 8 bit computers to be used with your emulator. Maybe this could make the emulation more perfect...

For me, I am only interested in the contents of those Atari special chips (which were special, because only Atari produced them, I think).

Hi,

The good news (for you) is that I've decided to clear out some of my
old 8-bit stuff - mainly mags, a few books and software. This is material
that I doubt I'll ever look at again (though I am keeping my computer
and most of the software). The list looks something like this:

Magazines:
Antic 67 issues between v2.2 and v9.1 (inc some cover disks)
Analog issues 8,9,11-14,17-58

Manuals/Technical Documents:
*** De Re Atari ***
ATARI 400/800 Operating System Source Listing
ATARI Personal Computer System Operating System User's Manual Volume 1
(Copy)
ATARI Personal Computer System Operating System User's Manual Volume 2
(Copy)
ATARI Personal Computer System ATARI 400/800 Hardware Manual (Copy)

Books:
Compute's First Book of Atari
Atari Games and Recreations - Kohl, Kahn, Lindsay and Cleland
The Atari Assembler - Inman and Inman
Atari Basic - Albrect, Finkel and Brown
Atari Macro Assembler

Software:
Basic A+
QS Forth
OS/A+
A few games and disk and a few more on tape

Hardware:
Cartridge Backup System

Initially, I just want this lot to go off to a good home - I will give it to
anyone
who wants to come get it ! The bad news (for a lot of people) is that
I'm based in Salford, UK.

If anybody's interested e-mail me direct at:

kw@parisdata.co.uk

>Basic with the PDL(0) and PDL(1) calls.

(My mistake. Guess I was only half right about the Apple =-))

Except that a small bit of time had to be wasted between both PDL
calls (in order to minimize "crosschatter." Here's a BASIC line taken
out of page 292 of "INSIDE THE APPLE II":

100 X=PDL(0):FOR I = 1 TO 10: NEXT I: Y=PDL(1)

If paddle "crosschatter" made even slow BASIC wait for a few loops,
imagine the amount of time wasted in machine language!

I don't remember exactly -- only that there were several models, and
that at least two of them were Sharps.

(I bought a Sharp Zaurus PDA for 25000 yen, which I use as a bilingual
dictionary. You can write on it in Japanese characters and get the
pronunciation and English translation. Much more convenient than
trying to use a paper dictionary.)

I'd personally love to see a 3D computer.

All mainstream computing is done in 2D - the most basic dimension being
the value of a whole byte, or the arbitrary values of bits in a byte
(whichever way you look at it) and the second being the address in memory.

Can you imagine the complexity in programming a computer that worked in
many dimensions? It'd be mindblowing. Jeff Minter would probably be able
to handle it, though. :-)

Although....

Does that make a computer with *PAGED MEMORY* 3D?

ie Byte, page, absolute address...?

[Why oh why do I always contradict myself?

Don't be so melodramatic. It hardly ever happens.]

I wouldn't say so myself, as switching pages usually is a slightly
complicated affair. It would be possible under some systems (eg the simple
256K C64 upgrade on Marko Makaela's page) to write programs that would
bounce backwards and forwards between pages all the way through execution
at the slightest notice, although there would still be no logical
progression between pages.

Logical progression?

By this I mean the carry that makes a series of bits a single byte,
representing a number, and the sequential execution of commands within a
page (as well as limited distance branches which give a page a definable
'size').

Course, you probably meant graphics... ;-)

Sure you can- device drivers, text searching engines, VBI based graphics,
horizontally smooth scrolling large datasets thru a graphics 8 display-
the possiblities are endless. Just goes to prove Microsoft never
implemented anything substantive; if something is substantive then
it is efficient. Therefore, if something isn't efficient, its also not
substantive. Simple enough..

;)

Maybe they're counting that new European C64 thing. Is it actually out yet or still a prototype? AFAIR it's a tiny DOS based PC with some clever hacks/software to make it run C64 software via an emulator. Also has amodem/browser and all that kind of stuff. Far too expensive for what it is though - £300 was being mooted as a figure.

That doesn't make much sense, as I usually turn off my computer and boot a disk. I would rather think a virus would spread a lot more thru executable files. Like loading a program and swapping disks and loading another wouldn't create a virus problem. When I use my C64, I usually don't turn it off when I start various programs, so I do think the Atari is safer really. Are there any Atari 8-bit viruses at all ? I have a games somewhere I think with viruses in them, Epidemic, but it doesn't spread to anything else than the map on screen.

>Also the ROM's were auto addressing.

You do remember correctly -- the TI uses video memory for program storage space, and BASIC is written in GPL and stored in GROM, requiring a double interpretation step to run your programs. Worse, the 9900, despite having a 16-bit data bus, only has 8 bits of the bus physically connected to the board. TI consumer electronics engineering strikes again.

The Tomy Tutor, a TI-like system based on the later 9995, has a similar architecture but the chip is not crippled (it uses a prefetch mechanism to accept 16-bit instructions through its 8-bit data bus) and Tomy BASIC, which is organised similarly to TI XBASIC, is 100% assembly.

It does have some similarity, but you don't have to type lllllllll to
enter in all the characters on your line in vi :-)

>I was very confused the first time I used the Commodore 64, which
>doesn't have the concept of "active input line" but allows you to

>that line. How weird!

Actually, I find it very logical -- what you see is what you get. If it's
on the screen, it gets entered. Sometimes that gets a bit annoying when you
have to erase things, though, to stop the screen editor from picking them
up also.

COMPUTE once said, to someone who was a VAX user who had bought a C64 for
home use and was puzzling over the editor (didn't understand it, was expecting
vi, I suppose), that the 64's screen editor system was actually considered
very good for a machine of its class.

>Many Basic programmers bought third-party add-ons to Basic that
>added an "Edit" command. My favorite was Beagle Brothers' GPLE.

Yep! I have this one. Very handy, liked it *much* better.

Would that happen to be Star Trek? Also, this one is to Aaron, where in
the hell did you see a C64 cost $700??? Forget that! I would go w/ the
pentium (considering that's how much mine cost). Now, if there was an
Atari Mega ST for that much, I would snatch it up quick.

Hehe...I used to use Rainbow (Atari Emulator) on one of my Macintoshes.
I then got Atari800Win for PC, and going to get my Atari collection (at
least some) back from my dad and make disk images of Atari programs out
of various programming books (Antic mostly) and also the game and
program collection I have and put it on a web site I am trying to make.

Basically now, w/ my lil' project I am trying to do, I am going to be
using ALL of my systems now (that's a hellofalot).

Wasn't there a handheld game that was 3D that Atari made? I remember
reading about it on Curt's site. Also, there was/is a 3D monitor made
by SUN Microsystems for CAD/CAM that looks like a table and reflects
upward. It was/is REALLY expensive though (I think like $30,000).

The article was sent to you as an attachment so you should have been able
to simply save it to your ISP's HD and then d/l it, or d/l it directly.

Anyway, I'll email you straight ASCII later today. Problem is I have to
exit ProComm Plus and use Procomm 2.43 to upload to my local freenet. For
some reason, PCPLUS allows me to d/l using a DTE speed of 19k2 with a 9600
baud modem and things just fly (sometimes better than 1000 cps using
DSZ or MSKERMIT), but uploading with the same software and DTE speed
always chokes; on the other hand Procomm 2.43 only allows a DTE speed of

9600 and uploads work fine. To complicate things, the computer has to be powered off and on to get the serial ports to work correctly if, for some masochistic reason, I've been running Windoze 3.1.

I'd be better able to analyze your upgrade settings if you described which bits do what. i.e. there should be one to select which of two 512k halves, one to select the 256k half within the 512k, two to select the 64k block within 256k, and two to select 16k bank within the 64k block.

Also, how are the page sequence values you gave placed into PORTB? i.e. do you use STA, AND, ORA, or EOR? Obviously this makes a big difference.

BTW the "BASIC bit problem" is that the OS knows nothing about extra RAM so when it boots it sets bit 1 in PORTB based solely on the Option key--it does no tests. If your upgrade uses bit 1 for bank selection and the controlling software makes any assumptions about its current status, that is probably the source of the problem. I did program a fix for this in the modified MYDOS 4.53 I sent you that adds about 50 bytes to Memlo but, since the RD's incompatible with your setup, try this: boot with the Option key down, check out your RD, and then enable BASIC using software.

John

I don't know of any specific Coleco Adam newsgroups but some of the regulars on REC.GAMES.VIDEO.CLASSIC may be able to help you with basic Adam questions. I'm not sure how extensive their knowledge is but I've never seen someone flamed for an Adam question there. For more in depth information you may wish to get in contact with members of the Adam cult. Here are a couple of URLs that may prove useful. Good Luck!

> the settings for the 130XE's 128K scheme, but need it up to the 1088K bank
> (PORTB settings)

Unfortunately different upgrades use different bit combinations for
accessing extended RAM, so the specifics will vary according to the
upgrade. A good place to look for information is at the BRiTiSH
Underground site:
http://aegis.mcs.kent.edu/~clisowsk/8bit.html

There's upgrade information for 256, 320, 512, 576 and 1088K
modifications there. Also not all upgrades allow ANTIC to access the
extended RAM, most just allow the CPU access.

All XE compatible upgrades use bit 4 for enabling the extended RAM to
the CPU, and bits 2 and 3 for selecting the extended bank. Larger
expansions then start using up the other bits in PORTB, bit 6 (the
last remaining unused bit in PORTB) is the next one to be used, then
generally bit 5 (you lose separate ANTIC access to extended RAM), bit
7 (Self Test enable), and finally bit 1 (you lose BASIC). An
exception to this is Mathy van Nisselroy's new 1MB upgrade, which
keeps bit 5 for separate ANTIC access to extended RAM, and uses bit 0
(OS RAM enable) instead while still being able to toggle BASIC and OS
RAM when main is enabled RAM.

Arguments still given :-)

Just a momemt. A "JSR" would imply an "RTS" at the end of the OS
routine, which would cause the Program Counter to begin executing
instructions at the beginning of the text string (which immediately
follows the "JSR"). Needless to say, a computer crash would be
inevitable.

Is the return address on the Stack recalculated to point to the end of
the null terminated string, where, hopefully more program code
resides? Or, perhaps, the "JSR" was a mistake and should have been a
"JMP" followed by an "RTS"? It's a bit confusing. :-(

Is there a limit to the size of the string? Can it be greater than
256?

What if the size of the string needs to be dynamically
modified/resized? The design of this OS feature appears to produce the
need to mix data with program code which, if one isn't very, very
careful with string manipulation, could cause a computer crash. I much
prefer the concept of separating all program code from the data (even
though most Assembly language programmers don't follow this advice).

The above comment isn't meant to imply I'm an expert at assembly (I most definitely am not).

No. Pull the return address off the stack, display the string using indirect
addressing, and then ...

>Is the return address on the Stack recalculated to point to the end of
>the null terminated string, where, hopefully more program code
>resides?

... yes.

>Is there a limit to the size of the string? Can it be greater than

It's probably a simple register index, so I would guess it's 255 characters
or less. I don't have the disassembly in front of me at the moment.

Well, then, do that. No one has to use PRIMM to display things, after all.
Write your own handler, and use CHROUT/BSOUT to print individual characters.
But PRIMM is very handy for inlining prompts, which is what it was designed

for, as I hear.

Nope. Neither am I, but I do understand this one. The assembler syntax
given in these examples creates the string at a convenient place for the
assembler to point to. It is not smack dab in the middle of the program
code. They're just giving you the absolute bare bones details, which are
the command, the Kernal call, and the .data.

>If you know where I can get an old drum corps uniform, email me.

The Video Touch Pad and the Kids controller and the keyboard
controller are essentially the same device, they differ only in
appearance, and size. I have never seen stuff on the 400/800/XL/XE
that uses or supports it. I wrote a small driver that can be used to
put it to some use. I wrote a small text for a Dutch magazine on
the subject. It is in Dutch of course, so you probably cannot
make sense of it, but the code works, and it comes with a
small demo program. If anyone is interested, let me know, and
I can E-mail an ATR file, containing the assembler source code,
the basic demo program. It is also on the Pooldisk Too of course...
Since it is a weird device, you have to scan the keymatrix yourself,
so you have to program a joystick port for output, and check the
matrix yourself row by row. Kinda hard, so I wrote a program for
page 6 that runs in the DLI, and then you can simply peek and
poke from BASIC without loosing a lot of processor time.

It might be used for quiz games, driving games, or whatever,
You can depress multiple keys, but detecting of that is somewhat
a problem, since currents start to run in unexpected directions, so
you would have to add a bunch of diodes to prevent this if you
want to check out all the keys that have been depressed.
Anyway, if you want to try my stuff, let me know.

Keep those XL's/XE's humming.

Yes, the new address is calculated and placed on the stack. IIRC, there are two PLA's, and a few ADC's afterwards to recalculate, and then two PHA's. That way, the RTS returns to just after the string, null terminated of course.

>
> Is the return address on the Stack recalculated to point to the end of

The stock routine is limited to 256 characters, yes, as is my PRIMMV example in another followup. It isn't hard to rewrite these routines however, and it gives the programmer some experience with stack manipulation.

>

See PRIMMV. I agree, strings and the like should be separated from actual code. IE: a code fork and a data fork.

> The above comment isn't meant to imply I'm an expert at assembly (I

How is that inflexible?

It is an easy way to print embedded strings, and you could also do what
I do, make a routine called PRIMMV:

```
PRIMMV =*
STX PRIMMVZP+0
STY PRIMMVZP+1
LDY #$00
- LDA (PRIMMVZP),Y
BEQ +
JSR CHROUT
INY
BNE -
+ RTS
```

Virtually the same routine, but uses a vector instead of enbedded.

You are.

I have seen at least one video game in the arcades, over three years ago, that had a TRUE holographic three dimensional projection. It was a fight game of sorts. Sadly, I haven't seen one since.

The game was a "table-top" game, with controls for two players on the sides.

However, if you are refering to _true_ holodeck technology, AFAIK, that would require forcefields around each projected holographic entity, so that if you touched it, your finger would stop at an actual physical surface. This is the premise behind ST holodecks, I believe.

yeah i know it is a shame the atari didnt have a built in monitor.... my first computer was the commie plus 4 and then got an atari afterwards.... the only thing i didnt like about the atari was the monitor.... consequently i replaced the basic rom with the atari assembler/editor on my 130xe.... then later got omnimon.....

sort of like if you tell atari users atari dos and atari basic were developed
on an apple // their head might explode ;') personally i have an atari (800
and 1200xl) on my desk an apple //gs and to macintosh's (would have an amiga
if i had the space....) i remember when i first started using the atari.... i
would do things with peeks and pokes on the atari because i was used to doing
it that way on my commie.... but it only made it easier when i went to assem,
because i knew the mem locations and what needed to be poked where....

actually.... the atari sio runs at 19.2k stock (it is basically a rs232 with
ttl voltage levels) when a us doubler is added to the 1050 it runs at ~56k
this is a limitation of the drive not the atari, the 1050's cpu (6507,
basically a 6502 with 8k addres space and no irq's (IIRC)) is clocked at
500khz (yes half a mhz!!!) but the 8bit itself can do up to 115.2k across the
pbi.....

Hi,

You answered you own question when you quoted the opening statement pronounced by the program: SAM (Sound Actuated Mouth). Cute program, not true text-speech, but with some creative modifying of words you could get it to say almost anything you wanted.

>Close... I think it was Software Actuated Mouth.

Actually, correct. "Software Automatic Mouth" (c) 1982 from "Don't Ask"
Computer
Software.

And very good, too, although I always found
the screen blanking (killing Antic) took away
a lot from a program using SAM.

>
>Yuck! That would be a pain in the arse for me...

I would assume that, with the cartridge version of SpartaDOS, one
could bypass the need for disk booting.

Did any versions of the 1541's internal ROM contain bugs to prevent
the drive from being usable with certain functions? (requiring the
need to upgrade the ROM?)

>> The C64 also needs
>> to load in a DOS in order to use disks, it's just that it loads it in

>Program of the Fast Hack'em series, btw.).

Just imagine, If the C-64's drives had autobooting capability, a
special copying utility could automatically be placed from disk into
the 1541's RAM for easy disk duplication without any need to *EVER*
hook up the C-64! Now, wouldn't THAT be powerful?!!

This depends on the system. The C128 Kernal has the PRIMM function:

```
JSR PRIMM
.ASC "text"
.BYT null
```

Which prints an embedded string following the JSR, null-terminated.

I thought the number seemed a little inflated.

Maybe this imaginary loader uses the parallel bus.. in which case, 14 cycles per byte, plus 11 more every 256th byte, is attainable.

> with the Apple II+?).

There's nothing weird about it, it's just a different conception of how to input data. On the Apple II, there is only one active input line. Pushing ESC once puts the cursor in "move" mode, and then you can use IJKM (not IJKL, though that would have been easier) to move anywhere on the screen. Pushing ESC a second time restores "input" mode. You can then use the -> key to "trace" over characters, which puts them in the input buffer just as if you had typed them in. Of course, a consequence of this is that RETURN truncates the input. You have to trace to the end of the line you want to edit. It's much easier to use than to explain.

It has some similarity to the way the Unix editor "vi" works. I wonder if Wozniak (or whoever at Apple implemented the escape mode) knew about vi.

I was very confused the first time I used the Commodore 64, which doesn't have the concept of "active input line" but allows you to edit any line displayed on the screen by moving up the cursor to that line. How weird!

BTW, about arrow keys: the II had left and right arrows. The first Apple II to have up and down arrows was the Apple IIe (but the III came before the IIe and also had arrow keys as well as two "Apple" keys). On the IIe, you could use the arrow keys instead of IJKM, but you still had to use ESC to toggle between modes.

Many Basic programmers bought third-party add-ons to Basic that added an "Edit" command. My favorite was Beagle Brothers' GPLE.

Howdy John

Could be. I have your text somewhere. But you posted it in MIME or something
(not clear ASCII) and I haven't been able to turn it into (AT)ASCII yet.

Without BASIC everything goes fine. With BASIC, the directory (of the RAMdisk)
is empty. Althoug DUP and MEM should be in there. And the amount of free
sectors is exactly the same as without BASIC.

Ofcource, with RAMDRIVE by Rafael J. Espino, everything goes 100% OK. But
that's not as sofisticated (YET) as RB6C (the RAmdisk handler that came with
MyDOS 4.53/3) and it uses the second character set. So untill I find a spot
for RAMDRIVE 1.0 to relocate itself to, it will not run with the US+ OS (or any
other OS that uses the second character set.)

Howdy folks

A while ago, Bob Woolley mentioned he thought there was a second character set inside the NS405 (the main chip in the XEP80) that was mangled and that ATARI bought a pile of halve useless chips.

According to the booklet that came with one of my XEP80's, the second set only contains 58 characters (only the ATARI specific characters are replaced I guess). And ALL characters of both sets are 10 by 7 (yes SEVEN) bits wide.

Maybe that's what causes some confusion.

1398. Atari stuff in NE Ohio

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-28 00:00:00 UTC
From: Mike Ferrell <mferrell@gwis.com>
Message-ID: <01be4a60$f0ac6ba0$314a39d1@thebig1>
Source record: 55314

I have some Atari equipment I would like to pass on to someone who can make more use of it. I would rather not dump it at some place like the Salvation Army because they would not see the true value of it and might throw it away.

I have the following:
* Atari 800
* Atari 400 (not working right)
* Atari 1010 program recorder
* Atari 410 program recorder
* Atari 300-baud modem
* AlphaCom 81 80-column printer
* Atari Touch Tablet
* ST Transformer cable? (I think that's what it was)
* large collection of magazines: Antic, Analog, Compute
* large collection of software of questionable origin (it came with the XE below)

When I am done transferring my personal files to my PC, I will also be getting rid of:
* working Atari 130 XE
* 2 Atari 1050 disk drives with US doubler chips installed
* ICD P: R: Connection
* video cord: composite to A/V

That could be some months down the road though.

Money in exchange would be nice (to pay for a PC upgrade or a low-end Linux system), but right now the stuff is basically in the way (gotta have room for that fiancee). Preferably, someone in the area or willing to drive the distance or pay the postage or whatever would take it off my hands as painlessly and/or profitably as possible. Advice is also welcome.

Thanks,

Mike Ferrell

It is my opinion that a booted, or software based DOS is a superior solution than a ROM coded one. There are of course exceptions, like if the ROM based solution has it's own special bank switching which allows a large feature rich DOS to be inserted into a relatively small address space. That advantage may outweigh the flexability of software loaded DOS on a system with limited RAM addressing available.

1400. Atari "Fastloader" (?)

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-28 00:00:00 UTC
From: lwhite6497@aol.com
Message-ID: <19990128003008.09694.00000819@ng25.aol.com>
Source record: 55316

In the "Atari vs. C64" thread, several
mentions have been made of C64
fastloaders for the 1541-type drives
that load at up to 40X (fastest I've
seen mentioned). So far, no one
has responded to my request for
more info about one of these. The
request is genuine - I also have a 64 and
always like to learn about new things
for it, also.
Two points about this:
1. The fastest "speed-up" that I
know of for the 64 claims no more than
15X, and this uses more than one
line in the serial cable to transmit data.
The Atari has more lines in the SIO
cable than the 64 cable, so even if it took
a little additional hardware, it seems
like the same approach could work for
the A8, but AFAIK no one has done it. (?)

2. The 40X certainly could still be true,
but my guess is that the 40X comes about
this way. Copy protection busters abound(ed)
for the 64, and some were combined with
fastloader routines, so if an original game
on a stock 64/1541 took 120 seconds to load,
and the fast loading version (minus the
copy protection) took 6 seconds, then
you have a 20X fastloader, but much of the
speed increase is from the copy protection
removal. When A8 folks think about drive
speed-ups, I don't think that most of us
consider it it in this way. It's either 19.2
or (apx) 55 Kbs (or 84 Kbs on some
PAL systems), which probably means that
some 3rd party drives are clocked faster
e.g. 2 MHz instead of 1 MHz. BTW,
I can't tell much if any difference
in drive speed (loading, saving, copying)
between a (Warp) A8 and a 64@15X.
Larry

What could be better than putting a software based DOS in a Commodore
64 REU expansion unit? (JOKE)

NOTE: An REU is a Ram Expansion Unit for Commodore computers which
allows for a maximum of 512K of additional RAM (and up to Megs with
hardware hacking). The unfortunate aspect of this RAM is that (unlike
the Apple's and Atari's and C-128's bank switched RAM method) it isn't
directly addressable. Instead, hardware on the REU must transfer the
data stored in the REU, one byte at a time, into (and out of) the
C-64's main 64K of memory. Needless to say, this is a lengthy
explanation for a stupid joke =-)

Please correct me if I'm wrong.

Skipping the assembler directive, the first two lines of code appears
to set up the location of the actual string to be printed.

line 4 pulls the current character from the string and line 6 calls
the OS routine to place it on the screen.

Although the above program will print a maximum of 256 (or is it 255?)
characters, I assume adding 1 to PRIMMVZP+1 (and some additional
logic) could allow for strings greater than 256?

12 labours of Hercules? Let's see. Here they are.

1) Attempting to act as well as his best friend.
2) Remembering himself and his best friend when they were younger and
completely different people.
3) Leaving his best friend to marry someone who isn't human only to
return to his best friend after she dies.
4) Marrying his dead wife when he's not pretending to be Hercules.
5) Seeing his best friend in drag without realizing who he is.
6) Suggesting ways (in front of his dead wife) of killing off his best
friend (while he's an actor portraying Hercules when, in fact, he is
Hercules).
7) Watching his best friend die.
8) Seeing his dead best friend alive (but isn't quite the friend he
remembers).
9) Wanting to kill his dead best friend, but can't because that would
be bad.
10) Seeing his dead best friend trying to kill his other friends.
11) Helping to prevent his dead best friend kill his other friends
(who initially were anything but friends).
12) Being killed by Xena every week (in the ratings) even though both
pretty much had to deal with most of the 11 previous labors.

I think that was what mine was. It was a "PC-?" which could have been
a "PC-4", I am not sure. But I think my problem with it was impatience
more than anything else. I just didn't like a one-line screen.
Actually, I did become familiar with it. It seemed to be much more of
a programmable calculator more than anything else, and for that it was
pretty powerful. And I will admit that it did string manipulations
quite well. But its usefulness diminished rapidly when someone's fat
behind left a lasting impression on its fragmented remains. :-(

I agree that a Windows-style autostart is generally a bad idea, but
there is something to be said for a simple way of booting a disk, if
one wishes to do so. That is what the Apple II and (I believe) the
Atari have. Inserting a disk doesn't do anything by itself (indeed,
the Apple II has no way of telling when the user inserts a new disk).
But if a disk is bootable, then typing OpenApple-Ctrl-Reset will
boot it and "autostart" it.

In my opinion, that's the best way to do it. Neither completely
automatic, so the user stays in control (if I don't want to boot
the disk, I don't use the reboot command), and not completely
manual (it's easier for a novice to learn to type three keys
than a complex command, and it's also faster for an experienced
user).

True -- thank God. The auto-repeat rate of the Apple II was about
10 characters/second, which made tracing over a 200-character line
very tedious. I was glad to have the GPLE shortcuts ESC . and ESC ,
which moved the cursor 10 (?) characters at a time.

> >I was very confused the first time I used the Commodore 64, which

> on the screen, it gets entered.

I imagine one's preference will depend a lot on what system one
encounters first (the "baby duck syndrome"). But I like the Apple II
way because I always have a clear picture in my mind of what the
input buffer looked like. The C64 is confusing to me because I have
to look at the screen and make sure the parser doesn't get confused
about where the line ends. Maybe it's just the way my mind works --
I understand how the C64 editor works, it just doesn't feel natural
to me.

One thing that was very stupid, however, is how the LIST format often
interfered with the ESC editor. You had to POKE 33,33 to avoid
unwittingly adding spaces to quoted strings.

By the way: does the C64 Basic tokenize its statements or not? On the
Apple II, if you enter a line like 10FORX=1TO2:NEXTX, it gets listed
as "10 FOR X = 1 TO 2 : NEXT X" (almost), and the spaces are added by
the LIST command.

> >Many Basic programmers bought third-party add-ons to Basic that

"Program Writer" is another popular Basic editor that came a few years after GPLE. It is a full-screen editor, like the C64's, and very complete with several display options, macros, on-the-fly error checking, etc. I know a few programmers who swear by it. I tried it but went back to GPLE.

Wow, can you believe some of this stuff is nearly 20 years old???

If you see anything you want, need, etc MAKE an offer. (I prefer not to
set prices.)

If anyone wants to make an offer on the lot, go ahead....
people won't laugh at you (though even your pet anaconda may
shun you!)

Buyers will be responsible for all shipping/handling charges.

Sales to contiguous US only. (No, you don't have to spread a
disease...) On second thought, if you're willing to pay for this
stuff and you live in Botswanna or Brigadoon or Mogadishu or
wherever, yeah you can buy it. I draw the line at selling to the
White House... at least until I see the color of its $3-dollar Bills.

Atari Games for Sale

(All complete with boxes and documentation, unless otherwise noted)

CARTRIDGES
~~~~~~~~~~

**Atari

c Centipede Zap the worm and all his parts. Arcade
game.

**Imagic

c Atlantis Missile Command under water.

c Demon Attack Space Invaders with flapping wings.

**Spinnaker (once again, nice but heavy premium plastic packaging)

c Fraction Fever Shouldn't 98.6 be 98 3/5 ?

Details on those chips can be found here:
http://aegis.mcs.kent.edu/~clisowsk/8bit/atrtblc.html

Interesting idea to "make" those chips yourself, though you may be better
off to just buy the originals, which can be done here:
http://www.best-electronics-ca.com/

Hope that helps.

OOOPS, forgot to add Avalon Hill software.

If you see anything you want, need, etc MAKE an offer. (I prefer not to
set prices.)

If anyone wants to make an offer on the lot, go ahead....
people won't laugh at you (though even your pet anaconda may
shun you!)

Buyers will be responsible for all shipping/handling charges.
Sales to contiguous US only. (No, you don't have to spread a
disease...) On second thought, if you're willing to pay for this
stuff and you live in Botswanna or Brigadoon or Mogadishu or
wherever, yeah you can buy it. I draw the line at selling to the
White House... at least until I see the color of its $3-dollar Bills.

No, the printing data in right there inline with the machine code. You jump to the routine (leaving the return address on the stack), and the routine uses and increments the stack pointer to read and print the characters, then the return address is automagically pointing to the next instruction after the inline string.

I like those sounds because I can tell by listening whether it was loading
or not, especially when loading cassette programs. The tones got different
when there were errors reading cassettes (an all-too-frequent occurrence).

Is it true that the masks to these chips were lost by the last CREW that
owned ATARI?

> What information/data do these chips contain??

The PIA is a standard part. The rest are custom processors that either
operate according to registers on board the (i.e. Pokey), or access
system RAM (i.e. ANTIC). There is nothing to disassemble or to 'burn
into'

> Is there any disassembled info or listing about the contents of these chips ??

see above.

The amazing thing is that I've thought about doing a controller that
'did the ANTIC thing' but MAN, it's alot of sh*t for circa 1979.....

tony

1426. Re: Atari "Fastloader" (?)

Newsgroup: comp.sys.atari.8bit

If I understand it, the C64 loader routine has a changable vector pointing to it so a cart, modifys the vector and points to the code in the cart which is FAST code.

We're kinda stuck. Unless I miss my guess, the only way we could increase our speed is to go syncronous data transfer which would require a modified OS ROM....

An I right?

Tony

I never had an Atari disk drive faster than the Indus (with its fast mode),
but I recently tried using APE with its ultra-speed settings. I was blown
away at how fast things transferred. And, since it was accessing a PC's
hard drive, there weren't disk track change pauses as typical with a floppy.

> characters, I assume adding 1 to PRIMMVZP+1 (and some additional
> logic) could allow for strings greater than 256?

256 characters, since 0 <- .Y <- 255. And yes, w/ minor additional
code, you could modify the routine to print a true 16-bit address,
thusly $10000 bytes in length.

> the map on screen.

It is quite easy to infect a disc that autoboots.
Just autoboot the virus that duplicates itself into a new bootsector when
you're saving something (by modifying the DOS routines that are loaded),
the virus will also start the program that is supposed to be Auto-booted.
You won't even notice a virus, until it maybe destroys the directory
sector of your disc.
They could also hide in the autoboot and make it look like the disc was
empty and not autobooted.
Bootblock virusses are the most common virusses on Amiga and ST machines.
Be glad if you don't know any.. even on the C64 they managed to code 2 or
3 different ones.. and they have been extremely intelligent (pretty hard
to code a good virus on the 64).

The utility you need is called PKUNPAK.

1432. RAMJET Documentation

Newsgroup: comp.sys.atari.8bit
Date: 1999-01-29 00:00:00 UTC
From: "John K. Picken" <yg473@victoria.tc.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.990129000121.28879A-100000@vtn1>
Source record: 55398

I goofed on the docs included with RAMJET and HYPRAM. For the most part,
they are correct, but the following is missing:

---------- cut here ----------

FEATURES LACKING IN RAMJET

RAMJET supports neither Percom configuration nor enhanced density format
commands and it does not clear RAM when executing a format via an SIO
command--it does clear it when the RD is installed with format. In essence,
RAMJET is a stripped-down version of HYPRAM designed to trade off features
for decreased RAM usage and increased speed. If you want configurability
and real disk emulation, you have to use HYPRAM.

ERROR RETURNS

Either RD will return error #139 if it receives an unsupported or
illegal command or if a program tries to access a non-existent
sector.

---------- cut here ----------

I'm working on a new version now and this time I'll revise the docs
as I develop the program instead of nearly two years later :)

Apologies to anyone I confused.

John

How about an analog computer? Discrete numerical component data capable
of holding a near infinite number of different values (not simultaneously
of course). We'd also have the advantage of some more intolerable
acronyms. Such as ANIT - Analog Digit or (my personal fave) ANTE - Analog
Term :)

uh.. i'm not keeping up here.. but, if the mux has 8 connectors, and
there's a computer on every one of them, doesn't at least ONE of them
have to be a 'master' leaving the other 7 as slaves?

>Be glad if you don't know any

Which is why, before booting up a disk based game on my Amiga, I
always (and I mean ALWAYS) turn off the hard drive (via holding down
both mouse buttons upon warmstart and selecting the proper choices
from the onscreen options) .

>.. even on the C64 they managed to code 2 or
>3 different ones.. and they have been extremely intelligent (pretty hard

Considering the extreme intelligence of Microsoft programmers, I'm
surprised they haven't figured out a way of spreading their "virus"
onto the C-64. =-)

Unfortunately, without the proprietary sector skewing method, the US
Doublers weren't much faster than the plain vanilla (or is it
sherbet?) Atari disk drive. (I believe this was due to its limited
internal RAM buffer that couldn't hold more than a sector at a
time...Am I wrong?)

>and +12V, so you don't have to use the power-regulators inside the XF551 ?

I never liked the idea of cutting part of stuff. I've seem quite a few articles that tell me to take parts out of my drives and just solder in a connection to the switching power supply. I just don't like it.

Isn't it possible to upgrade the power parts of the XF (more power-regulators????) so it will run cooler? Make it like ATARI should have built them in the first place???

CU Mathy van Nisselroy

PS turn 10 VDC into heat? I thought they turned them into amps. Heat is a by product. Hell, what do you think you get when the powerstation turns 38kV into 220 VAC?

If you can not find the original software (incl.docs, box etc.) you might concider getting it of the internet. AR is PD now. Unfortunately, I can not remember where I found the City. I haven't found the dungeon yet or played the city. But the city will only run on my 1050, not my XF551.

>wire through the cable. Does anyone have a schematic for this unit? Am I
>going to be able to get replacement parts even if I determine what is wrong?
>Would I just be better off looking for a replacement?
>
>Dale

Try the following;

```
10 ? STICK(0):GOTO 10
RUN
```

Roll the ball. If nothing changes, open the trackball. Take out the ball.
Put it somewhere, where it will not roll away. Mouse-balls will do the same
BTW. Turn the little shafts. If the value on screen changes, clean the shafts
and the ball. You might wanna spray the ball with hair.... (damb, what's it
called. Women use it to style there hair. It's sticky. And no, it's not jell
:-)). If nothing changed, try taking out the shafts. There is probably a
light sensor where the wheels on the shaft where. Move a piece of paper in and
out of this. If the values still don't change, you'll have to go over the
solderconnection again.

Hope this helps.

CU Mathy van Nisselroy
